

## 7-ns BiCMOS PAL® with Output Latches

### Features

- Very high performance decoder with latched outputs
  - $t_{PD} = 7$  ns
  - $t_{LEO} = 5.5$  ns
  - $t_{IS} = 4$  ns
- 12 inputs
- 8 latched outputs
- 4 product terms per output
- Asynchronous output enable
- Power-on reset
- High noise immunity
- >2001V input protection from electrostatic discharge
- Advanced BiCMOS technology

- Available in 28-pin 300-mil PDIP and CerDIP, and in SOJ, PLCC, and LCC packages

### Functional Description

The CY7B339 is a 7-ns, 28-pin programmable logic device specially designed for decoding applications with high-performance general-purpose processors and fast state machines.

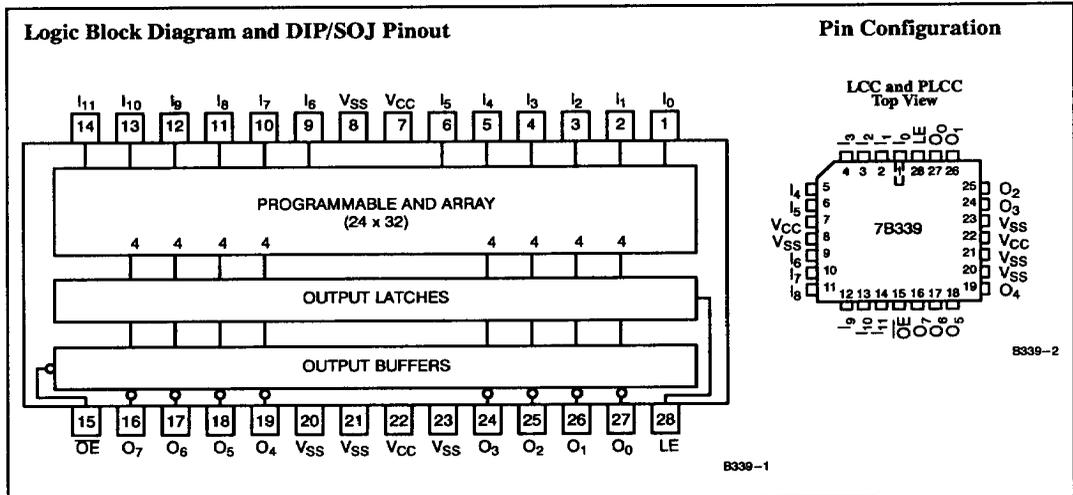

There are twelve inputs that feed into the 24 by 32 programmable array. Processed data from the programmable array is delivered to the eight output latches. When the latch enable input is HIGH, the output latches are transparent and data from the array is available to the output buffers. When the latch enable input goes from HIGH to LOW, the latch contents are frozen.

There are four product terms per output and all outputs can be three-stated using the output enable signal.

Additional features of the CY7B339 include a power-on reset circuit that initializes all output latches to a "0" upon power-up, and six centrally located power pins (two  $V_{CC}$  pins and four ground pins), which improve noise margins.

The CY7B339 is available in a wide variety of package types including 28-pin, 300-mil plastic and ceramic DIPs, SOJs, LCCs, and PLCCs.

**Maximum Ratings**

(Above which the useful life may be impaired. For user guidelines, not tested.)

- Storage Temperature ..... - 65°C to +150°C
- Ambient Temperature with Power Applied ..... - 55°C to +125°C
- Supply Voltage to Ground Potential (Pins 7 and 22 to Pins 8, 20, 21, and 23) ..... - 0.5V to +7.0V
- DC Voltage Applied to Outputs in High Z State ..... - 0.5V to +V<sub>CC</sub> Max.
- DC Input Voltage ..... - 0.5V to +V<sub>CC</sub> +0.5V
- Output Current into Outputs (LOW) ..... 12 mA
- DC Input Current ..... - 30 mA to +5 mA (Except during programming)

- DC Programming Voltage ..... 9.5V
- Static Discharge Voltage ..... > 2001V (per MIL-STD-883 Method 3015)
- Latch-Up Current ..... > 200 mA

**Operating Range**

| Range                   | Ambient Temperature | V <sub>CC</sub> |
|-------------------------|---------------------|-----------------|
|                         | Commercial          | 0°C to +70°C    |
| Military <sup>[1]</sup> | - 55°C to +125°C    | 5V ± 10%        |

**Capacitance<sup>[3]</sup>**

| Parameters       | Description        | Typ. | Max. | Units |
|------------------|--------------------|------|------|-------|
| C <sub>IN</sub>  | Input Capacitance  | 11   | 10   | pF    |
| C <sub>OUT</sub> | Output Capacitance | 9    | 10   | pF    |

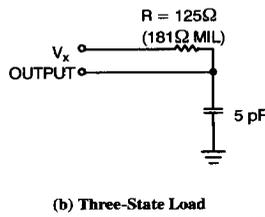

**Notes:**

1. T<sub>A</sub> is the "instant on" case temperature.
2. Not more than one output should be tested at a time. Duration of the short circuit should not be more than one second. V<sub>OUT</sub> = 0.5V has been chosen to avoid test problems caused by tester ground degradation.
3. Tested initially and after any design or process changes that may affect these parameters.
4. The normal test load is used for all parameters except for t<sub>pxz</sub> and t<sub>pzx</sub>, which are tested using the three-state load.

Notes:

- AC test load is used for all parameters except where noted.
- Maximum frequency data path (f<sub>MAXD</sub>) is limited by 1/t<sub>PD</sub> for the 7- and 9-ns commercial and the 8-ns military versions. Maximum frequency data path (f<sub>MAXD</sub>) is limited by 1/t<sub>P</sub> for the 10- and 12-ns military versions.
- This parameter is measured as the time that the previous output data state remains stable after the output disable signal is received. This delay is measured to the point at which a previous HIGH level has fallen to 0.5 volts below V<sub>OH</sub> Min. or a previous LOW level has risen to 0.5 volts above V<sub>OL</sub> Max.
- This part has been designed with the capability to reset during system power-up. Following power-up, the output latches will be reset to a logic LOW state. To insure proper operation, the rise in V<sub>CC</sub> must be monotonic and the timing constraints depicted in power-up reset waveforms must be satisfied. The latch enable input must be in a valid LOW state (V<sub>IN</sub> less than 0.8V) prior to occurrence of the 10% level on the monotonically rising power supply voltage. In addition, the latch enable signal must remain stable in that valid LOW state, as indicated, until the 90% level on the power supply voltage has been reached. The latch enable is allowed to change from its LOW state only after the indicated delay (t<sub>PR</sub>) has been observed.
