

PLL FREQUENCY SYNTHESIZER AND CONTROLLER FOR FM/MW/LW TUNER (AUTOMOBILE APPLICATION)

The μ PD17012GF-058 is a CMOS LSI chip designed for use in FM/MW/LW tuners utilizing a PLL frequency synthesizer design for worldwide applications.

The device incorporates a PLL frequency synthesizer controller, prescaler, and frequency counter. The device enables detachable stereo systems, and is ideal for use in electronic volume control circuits for automobile applications, high-performance FM/MW/LW tuners with a clock, and similar applications where compact dimensions are essential.

FEATURES

- Capable of receiving broadcasts from stations in all of the world's FM and MW bands, as well as the European LW band
- Applicable to AM up-conversion
- Many preset functions including manual tuning, auto-tuning (seek, scan), and preset memory scanning
- Independent preset memory with six buttons: up to 18 FM stations (six stations, each enabling the setting of FM1, FM2, and FM3), up to 12 MW stations (six stations, each enabling the setting of MW1 and MW2), and up to six LW stations
- Last channel memory for three FM stations, two MW stations, and one LW station
- ST (stereo) display (The ST display is also supported for the MW band.)
- Display and control output of MTL (METAL)
- Auto-preset memory function
- "CD" (compact disc)/"TRPE" (cassette tape) display
- LOUD (loudness) control output and display
- Clock function for 12-hour or 24-hour clock display
- Compatible with the external LCD controller/driver (μ PD7225)
- Built-in prescaler and frequency counter
- Remote-controller signal receiving function (when the μ PD6121 is used for transmitting signals)
- Detachable keys (or key section) and LCD panel
- Electronic volume control function (compatible with the I²C bus)
- Alarm function

ORDERING INFORMATION

Part number	Package
μ PD17012GF-058-3BE	64-pin plastic QFP (14 × 20 mm, 1.0 mm pitch)

The information in this document is subject to change without notice.

FUNCTION OVERVIEW

FREQUENCY TO BE RECEIVED, CHANNEL SEPARATION, REFERENCE FREQUENCY, AND INTERMEDIATE FREQUENCY

Area	Band	Frequency to be received	Channel separation	Reference frequency	Intermediate frequency
Eastern Europe	FM1	65 - 74 MHz	50 kHz	25 kHz	10.7 MHz
	FM2 FM3	87.5 - 108.0 MHz	50 kHz	25 kHz	10.7 MHz
	MW	522 - 1 620 kHz	9 kHz	9 kHz	450 kHz/+10.71 MHz
	LW	144 - 290 kHz	1 kHz	1 kHz	450 kHz/+10.71 MHz
Western Europe	FM	87.5 - 108.0 MHz	50 kHz	25 kHz	10.7 MHz
	MW	522 - 1 620 kHz	9 kHz	9 kHz	450 kHz/+10.71 MHz
	LW	144 - 290 kHz	1 kHz	1 kHz	450 kHz/+10.71 MHz
China	FM	87.0 - 108.0 MHz	50 kHz	25 kHz	10.7 MHz
	MW	531 - 1 602 kHz	9 kHz	9 kHz	450 kHz/+10.71 MHz
Australia, Middle East	FM	87.5 - 108.0 MHz	100 kHz	25 kHz	10.7 MHz
	MW	531 - 1 602 kHz	9 kHz	9 kHz	450 kHz/+10.71 MHz
U.S.A. 1	FM	87.5 - 108.0 MHz	100 kHz	25 kHz	10.7 MHz
	MW	530 - 1 620 kHz	10 kHz	10 kHz	450 kHz/+10.71 MHz
U.S.A. 2	FM	87.5 - 107.9 MHz	200 kHz	25 kHz	10.7 MHz
	MW	530 - 1 620 kHz	10 kHz	10 kHz	450 kHz/+10.71 MHz
U.S.A. 3	FM	87.5 - 107.9 MHz	200 kHz	25 kHz	10.7 MHz
	MW	530 - 1 710 kHz	10 kHz	10 kHz	450 kHz/+10.71 MHz
Japan	FM	76.0 - 90.0 MHz	100 kHz	25 kHz	-10.7 MHz
	MW	522 - 1 629 kHz	9 kHz	9 kHz	450 kHz/+10.71 MHz

RADIO FUNCTIONS

(1) Manual tuning

Function	Description
Manual up Manual down	Carries out tuning in step-by-step or fast-forward mode.

(2) Auto-tuning

Function	Description
Seek up	Detects a station and retains the frequency.
Scan up Scan down	Tunes to broadcasts of different stations for five seconds each.

(3) Preset memory scanning: Tunes to broadcasts of stations held in preset memory for five seconds each.

- (4) Preset memory
 - FM band: FM1: Six stations, FM2: Six stations, FM3: Six stations
 - MW band: MW1: Six stations, MW2: Six stations
 - LW band: Six stations
- (5) Last channel memory: One station each for FM1, FM2, FM3, MW1, MW2, LW
- (6) LOC (local) control output and display (The auto local function can be selected.)
- (7) ST (stereo) display function: Supported for the FM band. The display function is also supported for the MW band.
(A switching function is supported.)
- (8) Auto-storage

TAPE FUNCTIONS

- (1) Tape running direction display: Can be blinked at 2.5 Hz in fast-forward mode
- (2) MTL (METAL) control output and display
- (3) "TAPPE" (cassette tape) display function

ELECTRONIC VOLUME CONTROL FUNCTIONS

- (1) Volume/bass/treble/balance/fader function
- (2) "VOL" "BASS" "TRE" "BAL" "FAD" display on the LCD panel
- (3) Mute function (In the mute state, the entire panel display blinks.)
- (4) Loudness function
- (5) Four selectable gain levels (0 dB, 3.75 dB, 7.5 dB, or 11.25 dB)

CLOCK FUNCTIONS

- (1) Selectable 12-hour clock display (with AM/PM indication) or 24-hour clock display
- (2) Selectable colon (:) flashing (1 Hz)
- (3) Capable of back-up with low current consumption (up to 10 μ A) in no-clock mode

SECURITY FUNCTION

Enables of setting of the alarm function for security against car theft

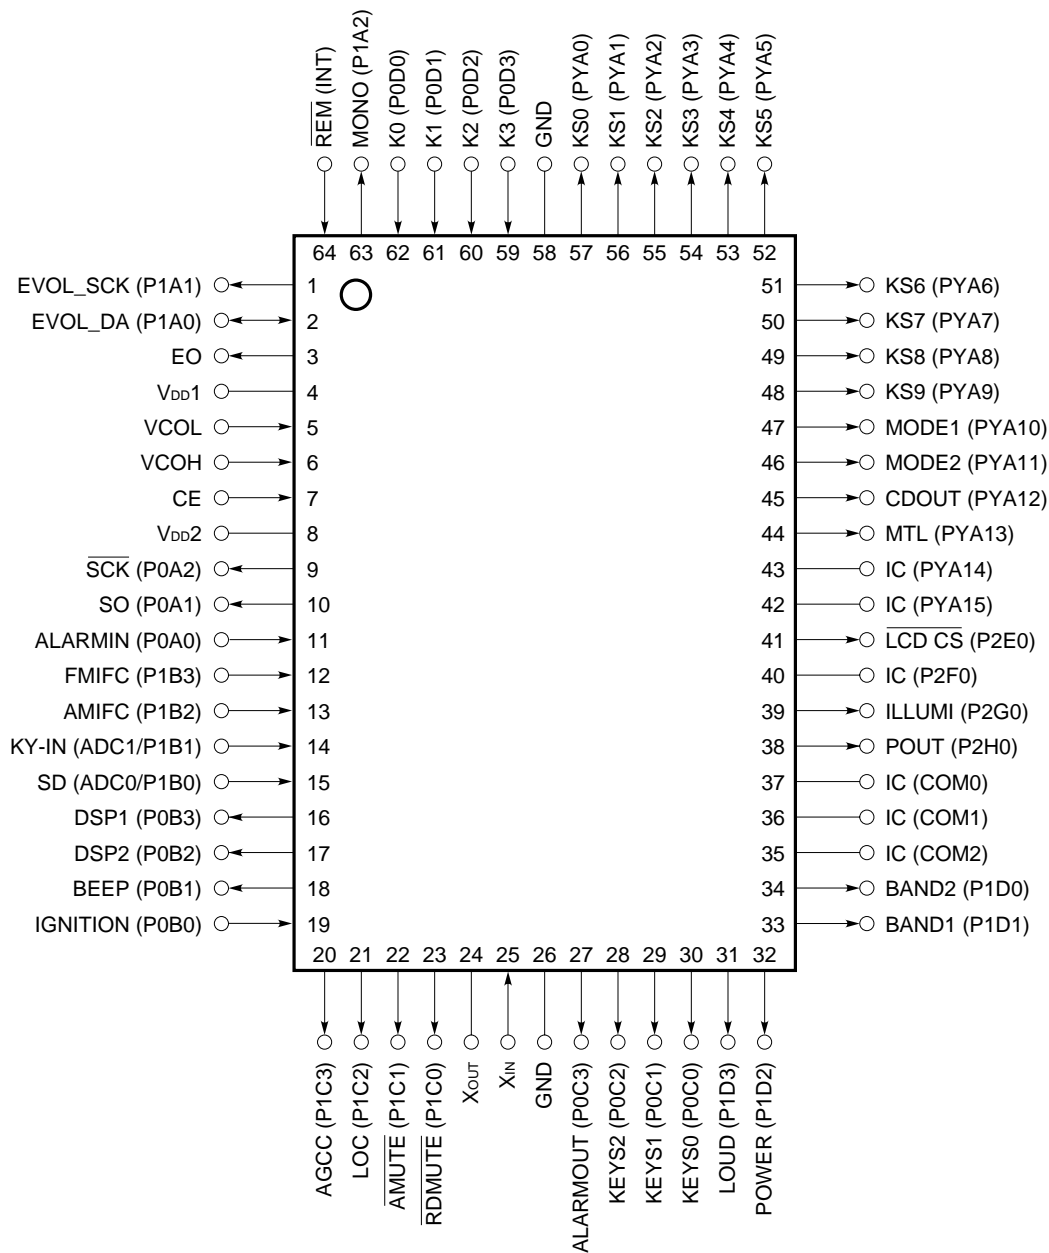

OTHERS

- (1) LOUD (loudness) control output and display: Common to radio, tape, and CD modes
- (2) Key acknowledge (beep) output: Performed if a valid momentary key is on
- (3) Display switching function and privileged display function
- (4) "CD" (compact disc) display
- (5) Compatible with the external LCD controller/driver (μ PD7225)
- (6) Remote-controller signal receiving function (when the μ PD6121 is used for transmitting signals)
- (7) Detachable keys (or key section) and LCD panel

PIN CONFIGURATION (TOP VIEW)

64-pin plastic QFP (14 × 20 mm, 1.0 mm pitch)

μPD17012GF-058-3BE

Remarks 1. The pin names enclosed in parentheses are those for the μPD17012GF-xxx-3BE.

2. IC indicates that the pin is internally connected. Leave the IC pins open.

1. PIN FUNCTIONS

Pin No.	Symbol	Pin name	Description	I/O type
1	EVOL_SCK	Clock output of electronic volume control	Clock output pin of electronic volume control For details of data output, see Appendix .	CMOS push-pull output
2	EVOL_DA	Data input/output of electronic volume control	Data input/output pin of electronic volume control For details of data output, see Appendix .	Input/output CMOS push-pull output
3	EO	Error out	Charge pump output pin of phase detector built into a PLL. If a divided oscillator frequency is higher than the reference frequency, the output of this pin goes high. If the divided oscillator frequency is lower, the output goes low. If the divided oscillator frequency agrees with the reference frequency, the output enters the floating state.	CMOS tristate output
4 8	V _{DD1} V _{DD2}	Power supply	Power-supply pin of the device This pin supplies a voltage of 5 V \pm 10 % while the device is operating. The rise time (0 to 4.5 V) of V _{DD} must not exceed 500 ms. If the rise time is significantly long or if the voltage falls below the operating voltage but is between 0 V and 3.5 V, the state of an initial setting diode switch may be read incorrectly.	-
5	VCOL	AM local oscillator input	Input pin of the local oscillator output (VCO) in the AM (MW, LW) band When tuned to broadcasts in the MW or LW band, this pin becomes active. Otherwise, the pin is internally pulled down. To protect the built-in AC amplifier, block the flow of direct current with a capacitor, then input the frequency.	Input
6	VCOH	FM local oscillator input	Input pin of the local oscillator output (VCO) in the FM band When tuned to broadcasts in the FM band, this pin becomes active. Otherwise, the pin is internally pulled down. Because an AC amplifier is incorporated, block the flow of direct current with a capacitor, then input the frequency.	Input
7	CE	Chip enable	Input pin of the device selection signal Always pull up the pin.	Input
9	$\overline{\text{SCK}}$	Serial clock output	Serial clock output pin for controlling the LCD controller/driver (μ PD7225)	CMOS push-pull output
10	SO	Serial data output	Serial data output pin for controlling the LCD controller/driver (μ PD7225)	CMOS push-pull output
11	ALARMIN	Door switch input	Input pin of the door switch See Chapter 3 for details.	Input

Pin No.	Symbol	Pin name	Description	I/O type												
12	FMIFC	FM intermediate frequency input	<p>Input pin of the intermediate frequency (IF) in the FM band To protect the built-in AC amplifier, block the flow of direct current with a capacitor, then input the frequency. When the ENFMIF switch (initial setting diode) is set to 1, this pin is used to detect a station during auto-tuning. If the input frequency range and conditions listed below are satisfied, it is judged that a station has been found.</p> <table border="1"> <thead> <tr> <th>Item</th> <th>Input frequency range <1></th> <th>Input frequency range <2></th> </tr> </thead> <tbody> <tr> <td>Band</td> <td></td> <td></td> </tr> <tr> <td>FM</td> <td>10.7 MHz ±50 kHz</td> <td>10.7 MHz ±12.5 kHz</td> </tr> </tbody> </table> <p>A frequency within input frequency range <1> must be input within 20 ms of the PLL being locked. If a frequency is included in both input frequency ranges <1> and <2>, it is judged that a station has been found. Auto-tuning is stopped.</p>	Item	Input frequency range <1>	Input frequency range <2>	Band			FM	10.7 MHz ±50 kHz	10.7 MHz ±12.5 kHz	Input			
Item	Input frequency range <1>	Input frequency range <2>														
Band																
FM	10.7 MHz ±50 kHz	10.7 MHz ±12.5 kHz														
13	AMIFC	AM intermediate frequency input	<p>Input pin for the intermediate frequency (IF) in the AM (MW, LW) band. To protect the built-in AC amplifier, block the flow of direct current with a capacitor, then input the frequency. If the initial setting diode ENAMIF is set to 1, this pin is used to detect whether a station is found in auto-tuning. If the input frequency range and conditions listed below are satisfied, it is judged that a station has been found.</p> <table border="1"> <thead> <tr> <th>Item</th> <th>Input frequency range <1> [kHz]</th> <th>Input frequency range <2> [kHz]</th> </tr> </thead> <tbody> <tr> <td>Band</td> <td></td> <td></td> </tr> <tr> <td>MW</td> <td>450 ± 5</td> <td>450 ± 2</td> </tr> <tr> <td>LW</td> <td>450 ± 5</td> <td>450 ± 0.5</td> </tr> </tbody> </table> <p>A frequency within input frequency range <1> must be input within 20 ms of the PLL being locked. If a frequency is included in both input frequency ranges <1> and <2>, it is judged that a station has been found. Auto-tuning is stopped.</p>	Item	Input frequency range <1> [kHz]	Input frequency range <2> [kHz]	Band			MW	450 ± 5	450 ± 2	LW	450 ± 5	450 ± 0.5	Input

2.6 Description of the Key Matrixes

2.6.1 Initial setting diode matrixes

The μ PD17012GF-058 has the following 18 initial setting diode matrixes. When the V_{DD} is supplied with power for the first time (at a power-on reset), the states of the diodes in these matrixes are read in. In all other occasions, they are ignored.

(1) Switches to specify the reception area

AREA1, AREA2, and AREA3

(2) Switches to specify the reception band

DISFM3, DISLW, ENFM, and ENMW2

(3) Switch to specify whether to use the auto-storage function

DISAMEMO

(4) Switches to specify whether to use the frequency counter for detecting broadcasting stations

ENAMIF and ENFMIF

(5) Switch to specify tuning operation

AUTO500

(6) Switches to specify display priority

PRI01 and PRI02

(7) Switches to specify the clock function

CLKDISP, FLASH, and NOCLK

(8) Switches to specify the tape function

KTAPE

(9) Switch to specify the mute output

MUTESEL

(10) Switch to specify the local operation

AUTOLOC

(11) Switch to specify the intermediate frequency for the AM (MW, LW) band

IFAM

(12) Switch to specify whether the MW band stereo reception function is available

MWS

(13) Switch to specify that the standby mode has no clock

CKHLT

- (14) **Switch to specify whether the electronic volume control fader function is available**
FAD_SEL

- (15) **Switch to specify which key (VOL UP/VOL DWN or MAN UP/MAN DWN) is used for electronic volume control**
VKYSEL

- (16) **Switches to specify the gain of the electronic volume control**
VOLATT_H and VOLATT_L

- (17) **Switches for setting illumination control**
ILLA and ILLB

- (18) **Switch for specifying whether the alarm function is used**
DISALARM

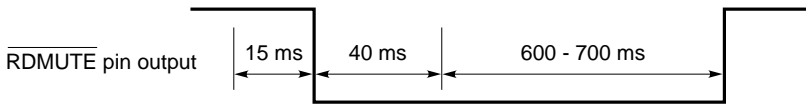

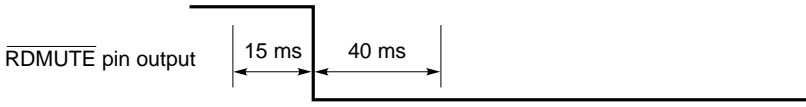

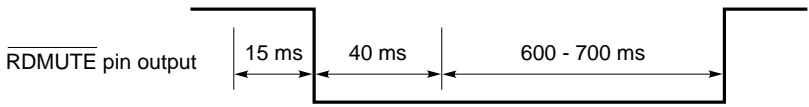

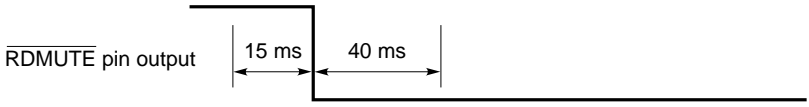

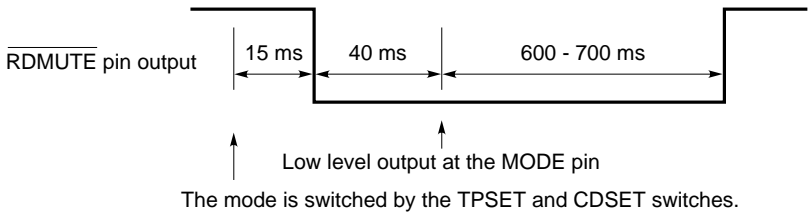

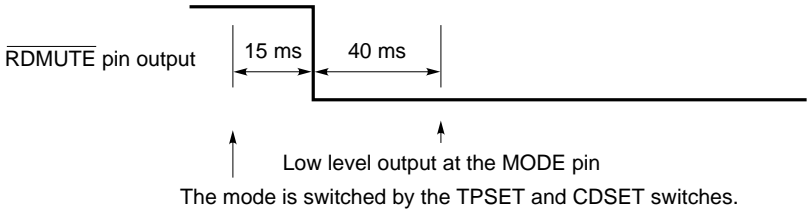

To set these switches to 1, short the diodes in each matrix. To set these switches to 0, keep the diodes open. The functions of the initial setting diode matrixes are summarized below (in alphabetical order).

Initial setting diode	Description																																				
<p>AREA1 AREA2 AREA3</p>	<p>These switches are used to specify the reception area. The following table lists the settings of the switches and the corresponding reception areas. 1	1	3.75 dB														

2.6.2 Alternation or transistor switch

In the following table, a statement that a switch is on (off) means that a high (low) level is input.

Alternation/ transistor switch	Description													
CDSET	This switch selects CD mode. It is effective only when the CE pins is at a high level. Setting this switch to on selects CD mode.													
DTH	This is the input switch to specify whether the detachable panel is attached. When this switch is off, it indicates that the panel is detached.													
FF	<p>This is the fast forward signal input switch for tape mode. The tape run direction indicator (◀▶) may light depending on the state of the RL switch as listed below.</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>FF</th> <th>RL</th> <th>Indicator</th> </tr> </thead> <tbody> <tr> <td rowspan="2">0</td> <td>0</td> <td>◀▶</td> </tr> <tr> <td>1</td> <td>▶◀</td> </tr> <tr> <td rowspan="2">1</td> <td>0</td> <td>◀▶</td> </tr> <tr> <td>1</td> <td>▶◀</td> </tr> </tbody> </table> <p>(▶ : Does not light ◀ : Lights ▶◀ : Blinks (at 2.5 Hz) 0 : Off 1 : On</p>	FF	RL	Indicator	0	0	◀▶	1	▶◀	1	0	◀▶	1	▶◀
FF	RL	Indicator												
0	0	◀▶												
	1	▶◀												
1	0	◀▶												
	1	▶◀												
RDSET	This switch selects radio mode. It is effective only when the CE pin is at a high level. If both CDSET and TPSET switches are off, setting the RDSET switch to on selects radio mode.													
RL	This is the forward run signal input switch for tape mode. The tape run direction indicator (◀▶) is controlled according to the state of the FF switch. See the description of the FF switch for the state of the indicator.													
ST	This switch is a stereo signal input switch for radio mode. For the FM band in radio mode, setting this switch to on turns on the "ST" display. If the stereo reception function is available for the MW band (initial setting diode MWS = 1), setting the ST switch to on with the MW band selected turns on the "ST" display. However, the display is turned off in the monaural state.													
TPSET	This switch selects tape mode. It is effective only when the CE pins is at a high level. If the CDSET switch is off, setting the TPSET switch to on selects tape mode.													

2.6.3 Momentary keys

The functions of the momentary keys are summarized below (in alphabetical order).

Momentary key	Description
<div style="border: 1px solid black; padding: 2px; display: inline-block;">ALARM</div>	<p>This key can be used only for setting alarm mode. This key is effective when the IGNITION pin is at the low level and DISALARM initial setting diode = 0. See Chapter 3 for details.</p>
<div style="border: 1px solid black; padding: 2px; display: inline-block;">BAND</div>	<p>The <div style="border: 1px solid black; padding: 2px; display: inline-block;">BAND</div> key is used to switch the reception band. This key is effective when the current mode is radio, radio-monitor tape, or radio-monitor CD mode. When the key is pressed, the reception band is switched sequentially as follows.</p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>→ FM1 → FM2 → FM3 → MW1 → MW2 → LW</p> </div> <p>However, inhibited bands are skipped. They are specified by the AREA1, AREA2, and AREA3 initial setting diodes (to specify reception areas) and the DISFM3, DISLW, ENFM, and ENMW2 initial setting diodes (to specify reception bands). The band display and last channel vary during band switching within the same type of band (FM1 → FM2 → FM3, MW1 → MW2). The <div style="border: 1px solid black; padding: 2px; display: inline-block;">BAND</div> key becomes ineffective in tape and CD modes.</p>
<div style="border: 1px solid black; padding: 2px; display: inline-block;">CD</div>	<p>Each time the <div style="border: 1px solid black; padding: 2px; display: inline-block;">CD</div> key is pressed, the output of the CDOUT pin (pin 45) is inverted. Using the CDOUT output makes it possible to implement an application such as described below: Turning on/off a transistor switch connected to the CDSET pin according to the CDOUT output can switch on/off the CD mode according to the state of the <div style="border: 1px solid black; padding: 2px; display: inline-block;">CD</div> key.</p> <div style="text-align: center; margin-top: 20px;"> </div>

Momentary key	Description																																
DISP	<p>The DISP key is used to switch the display. It is effective when NOCLK initial setting diode = 0 (with a clock).</p> <p>Display switching occurs as follows:</p> <p>(1) In radio mode</p> <p>Each time the key is pressed, the display switches between the frequency and clock.</p> <p>The DISP key is ineffective during seek-scanning and auto-preset scanning.</p> <p>The operation depends on the states of the PRIO1 and PRIO2 initial setting diodes as follows:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">PRIO1</th> <th style="width: 10%;">PRIO2</th> <th style="width: 15%;">Privileged display</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td style="text-align: center;">0</td> <td style="text-align: center;">None</td> <td>Each time the DISP key is pressed, the display switches between the frequency and clock.</td> </tr> <tr> <td style="text-align: center;">1</td> <td style="text-align: center;">0</td> <td style="text-align: center;">Frequency display</td> <td>Pressing the DISP key during frequency display causes the clock display to appear for 5 seconds. Calling	<p>The diagram illustrates the timing sequence for calling a preset memory. It shows three horizontal axes: RDMUTE pin output, Key operation, and Display. <ul style="list-style-type: none"> RDMUTE pin output: Starts with a 15 ms pulse, followed by a 2-second hold, then a 40 ms beep, and finally a 400-500 ms hold. Key operation: Shows 'M1 to M6 keys are on' during the 15 ms pulse and 'Keys are off' during the 2-second hold. Display: Shows 'Frequency or clock display' during the 15 ms pulse. During the 2-second hold, it displays 'The preset memory number corresponding to the pressed key is displayed. The frequency previously received is displayed.' During the 400-500 ms hold, it displays 'The preset memory number corresponding to the pressed key is displayed. The frequency recorded in the preset memory is displayed.' </p>																
<p>When the frequency recorded in the currently selected preset memory is being received, pressing the key corresponding to this preset memory does not trigger any operation except during clock display. During clock display, pressing the key not only generates a beep but also switches to the frequency display. Pressing the key, however, does not generate the radio mute signal.</p> <p>During the seek operation, pressing the key immediately accesses the preset memory.</p>

P.SCAN	The scan operation stops, and the current frequency is received.																
SCAN UP SCAN DWN SEEK UP MAN UP MAN DWN	The scan operation stops, the operation corresponding to the pressed key begins at the frequency being currently received.																
BAND	In radio, radio-monitor tape, and radio-monitor CD modes, the scan operation stops, and the operation corresponding to the pressed key begins at the frequency being currently received.																
RDMONI	Either of the following operations occurs depending on what the current mode is. (1) In radio mode The scan operation continues. The RDMONI key becomes ineffective. (2) In radio-monitor tape and radio-monitor CD modes The scan operation stops, and the operation corresponding to the pressed key begins at the frequency being currently received.																
LOUD/ILLUMINATION POWER	The scan operation continues. The operation corresponding to the pressed key begins.																
MONO/LOC	Either of the following operations occurs depending on the state of the AUTOLOC initial setting diode. (1) When AUTOLOC = 0: The scan operation continues. The operation corresponding to the MONO/LOC key begins. (2) When AUTOLOC = 1: The scan operation continues. The MONO/LOC key becomes ineffective.																
M1 M2 M3 M4 M5 M6	In radio, radio-monitor tape, and radio-monitor CD modes, the scan operation stops. The other operations vary depending on the timing at which the key is released. <ul style="list-style-type: none"> ● If the key is released within 2 seconds: The preset memory corresponding to the pressed key is accessed. ● If the key is kept pressed for at least 2 seconds: A frequency being currently received is written to the preset memory corresponding to the pressed key. 																

Momentary key	Description
<p style="border: 1px solid black; display: inline-block; padding: 2px;">P.SCAN</p>	<ul style="list-style-type: none"> ○ Auto-storage function Broadcasting stations are searched for automatically. The frequency of a detected station is written to a preset memory. A method used to detect a station is determined according to the states of the ENAMIF and ENFMIF initial setting diodes. A broadcasting station search begins at the frequency being currently received and is performed through the frequencies in the ascending order. When a station is detected, its frequency is written to a preset memory. For the voltage with SD, see the description of the SD in Chapter 1. The auto-storage operation varies depending on the state of the AUTOLOC initial setting diode as follows: (1) When AUTOLOC = 0 (with no auto local function): The auto-storage function varies depending on which mode has been selected, local or DX, when the function begins. <ul style="list-style-type: none"> (a) If DX mode has been selected when the auto-storage function starts: A search begins at the frequency being currently received and continues in the ascending order of the frequency. When all frequencies are searched through, the search operation ends. If the P. SCAN key is pressed during the search operation, the auto-storage operation ends, and the frequency selected when the auto-storage operation began is received. When all frequencies are searched through, if at least one station is detected, the contents of the preset memories are updated, and the preset scan begins at the M1 preset memory. How the contents of the preset memories are updated varies depending on the number of stations detected. <ul style="list-style-type: none"> ○ If six or more stations are detected: If six or more stations are detected, six stations with a higher SD input are selected and written to the preset memories. A lower frequency is written to a lower-numbered preset memory. ○ If less than six stations are detected: If less than six stations are detected, lower frequencies are written to lower-numbered preset memories. The contents of a preset memory will not be changed if there is no frequency corresponding to it. (b) If local mode has been selected when the auto-storage function starts: A search begins in local mode at the frequency being currently received and continues in the ascending order of the frequency. When all frequencies are searched through, if six or more stations are not detected, the search switches to DX mode and continues in it. If six or more stations are detected in local mode, or all frequencies are searched through in DX mode, the auto-storage operation ends. Pressing the P. SCAN key during the search operation stops the auto-storage operation, and causes the frequency selected when the auto-storage memory began to be received. If six or more stations are detected in local mode, or all frequencies are searched through in DX mode, the auto-storage operation ends. If at least one station is detected, the contents of the preset memories are updated, and the preset scan begins with the M1 preset memory. How the contents of the preset memories are updated varies depending on the number of stations detected, as follows: <ul style="list-style-type: none"> ○ If six or more stations are detected in local mode: If six or more stations are detected, six stations with a higher SD input are selected and written to the preset memories. A lower frequency is written to a lower-numbered preset memory ○ If less than six stations are detected in local mode and some are detected in DX mode, resulting in a total of six or more stations being detected: Stations detected in DX mode with higher SD input levels are selected and added to the number of stations detected in local mode so that the total becomes six. In this case, the stations detected in local mode are excluded from those detected in DX mode. The frequencies of the six stations are written to the preset memories, with a lower frequency written to a lower-numbered preset memory.

Momentary key	Description
<p>P.SCAN</p>	<ul style="list-style-type: none"> ○ If less than six stations are detected in local mode and some are detected in DX mode, resulting in a total of less than six stations being detected: If the same station is detected in DX and local modes, the station detected in DX mode is deleted so that the same frequency will not be written to two preset memories. The frequencies of the less than six stations detected are written to the preset memories, with a lower frequency written to a lower-numbered preset memory. The contents of a preset memory will not be changed if there is no frequency corresponding to it. <p>(2) When AUTOLOC = 1 (with the local function): A search begins in local mode at the frequency being currently received and continues in the ascending order of the frequency. When all frequencies are searched through, if six or more stations are not detected, the search switches to DX mode and continues in it. If six or more stations are detected in local mode, or all frequencies are searched through in DX mode, the auto-storage operations ends. Pressing the P. SCAN key in local mode switches to DX mode, and restarts the search operation at the frequency selected when the previous search began. Any stations detected in local mode are made ineffective. (Stations detected in local mode are excluded during preset memory updating.) Pressing the P. SCAN key in DX mode ends the auto-storage operation, and causes the frequency selected when the auto-storage operation began to be received.</p> <p>If six or more stations are detected in local mode, or all frequencies are searched through in DX mode, the auto-storage operation ends. If at least one station is detected, the contents of the preset memories are updated, and the preset scan begins with the M1 preset memory.</p> <p>How the contents of the preset memories are updated varies depending on the number of stations detected, as follows:</p> <ul style="list-style-type: none"> ○ If six or more stations are detected in local mode: If six or more stations are detected in local mode, six stations with a higher SD input are selected and written to the preset memories, with a lower frequency written to a lower-numbered preset memory. ○ If less than six stations are detected in local mode, and some are detected in DX mode, resulting in a total of six or more stations being detected: Stations detected in DX mode with higher SD input levels are selected and added to the number of stations detected in local mode so that the total becomes six. In this case, the stations detected in local mode are excluded from those detected in DX mode. The frequencies of the six stations are written to the preset memories, with a lower frequency written to a lower-numbered preset memory. ○ If less than six stations are detected in local mode and some are detected in DX mode, resulting in a total of less than six stations being detected: If the same station is detected in DX and local modes, the station detected in DX mode is deleted so that the same frequency will not be written to two preset memories. The frequencies of the less than six stations detected are written to the preset memories, with a lower frequency written to a lower-numbered preset memory. The contents of a preset memory will not be changed if there is no frequency corresponding to it.

Momentary key	Description										
<div style="border: 1px solid black; padding: 2px; display: inline-block;">RDMONI</div>	<p>The RDMONI key controls radio monitoring. It is effective in tape, CD, radio-monitor tape, or radio-monitor CD mode. Each time the key is pressed, radio monitor mode is set or reset. In radio monitor mode, the “RDMONI” display on the LCD panel lights.</p> <p>In radio monitor mode, tuning is enabled for all bands, the radio mute function ($\overline{\text{RDMUTE}}$ pin) is switched off, and the audio mute function ($\overline{\text{AMUTE}}$ pin) is switched on.</p> <p>Radio monitor mode is reset by:</p> <ul style="list-style-type: none"> ● Change in the TPSET switch state ● Change in the CDSET switch state ● Change at the CE pin from high level to low level^{Note} <p>Note When using alarm mode, always pull up the CE pin.</p>										
<div style="border: 1px solid black; padding: 2px; display: inline-block;">SCAN UP</div> <div style="border: 1px solid black; padding: 2px; display: inline-block;">SCAN DWN</div>	<p>The SCAN UP and SCAN DWN keys are used for auto-tuning (scan operation). Pressing the SCAN UP key (SCAN DWN key) increases (decreases) the frequency by one channel space and checks whether there is a broadcasting station at each reception frequency (frequency counter and SD signal). If a broadcasting station is detected, the corresponding frequency is held for five seconds. If no key is pressed within this hold time of five seconds, the seek operation restarts. If another broadcasting station is detected, the corresponding frequency is held in the frequency counter for five seconds. This operation is repeated (scan operation) sequentially.</p> <p>The frequency display blinks at 1 Hz (with a duty cycle of 50%) during the five-second hold time. A beep occurs at the end of the hold time.</p> <p>The seek operation here is the same as one performed with the SEEK UP key.</p> <p>The following table lists the operation corresponding to each key pressed during the seek operation (except the hold time).</p> <table border="1" data-bbox="344 968 1354 1885"> <thead> <tr> <th data-bbox="344 968 513 1020">Key</th> <th data-bbox="513 968 1354 1020">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="344 1020 513 1325"> <div style="border: 1px solid black; padding: 2px; display: inline-block;">SCAN UP</div> <div style="border: 1px solid black; padding: 2px; display: inline-block;">SCAN DWN</div> </td> <td data-bbox="513 1020 1354 1325"> <ul style="list-style-type: none"> ● If the SCAN UP key is pressed in scan-up mode, or the SCAN DWN key is pressed in scan-down mode: The scan operation stops, and the frequency that was selected when the scan operation began is reselected. If the auto local function is being used, local mode is switched. ● If the SCAN DWN key is pressed in scan-up mode, or the SCAN UP key is pressed in scan-down mode: The operation corresponding to the pressed key begins at the frequency that is selected when the key is pressed. </td> </tr> <tr> <td data-bbox="344 1325 513 1465"> <div style="border: 1px solid black; padding: 2px; display: inline-block;">SEEK UP</div> <div style="border: 1px solid black; padding: 2px; display: inline-block;">MAN UP</div> <div style="border: 1px solid black; padding: 2px; display: inline-block;">MAN DWN</div> <div style="border: 1px solid black; padding: 2px; display: inline-block;">P.SCAN</div> </td> <td data-bbox="513 1325 1354 1465"> <p>The scan operation stops, and the operation corresponding to the pressed key begins at the frequency that is selected when the key is pressed.</p> </td> </tr> <tr> <td data-bbox="344 1465 513 1606"> <div style="border: 1px solid black; padding: 2px; display: inline-block;">BAND</div> </td> <td data-bbox="513 1465 1354 1606"> <p>In radio, radio-monitor tape, and radio-monitor CD modes, the scan operation stops. Momentary key	Description
SCAN UP	
SCAN DWN	
Key	Description
M1 to M6	<p>The scan operation stops.</p> <p>Either of the following operations occurs depending on the timing at which the key is released.</p> <ul style="list-style-type: none"> ○ If the key is released within 2 seconds: A preset memory corresponding to the pressed key is accessed. ○ If the key is held pressed for at least 2 seconds: The frequency being currently received is written to the preset memory corresponding to the pressed key.
	<p>Example 1. If the key is released within 2 seconds: The tuner is set to the frequency in the preset memory corresponding to the pressed key when the key is released. The scan operation is canceled.</p>
	<p>The diagram shows the RDMUTE pin (active low) going high. A 'Seek' operation is indicated. 'Station detected' occurs. The 'M1' key is pressed and held for 'Within 5 seconds'. It is released 'Within 2 seconds' after the hold period. 'M1 accessed' is noted. The display sequence is: 90.0 (Example of display) → 90.1 (Blinking) → 90.1 iCH (Blinking) → 90.2 (Content of M1).</p>
	<p>2. If the key is pressed for at least 2 seconds: When the key is pressed for 2 seconds, the frequency on hold is written to the preset memory corresponding to the pressed key. The hold state is released 2 seconds after the writing to the preset memory, and a search (seek operation) for another station begins.</p>
	<p>The diagram shows the RDMUTE pin (active low) going high. A 'Seek' operation is indicated. 'Station detected' occurs. The 'M1' key is pressed and held for 'Within 5 seconds'. It is held for '2 seconds' after the hold period. The display sequence is: 90.0 (Example of display) → 90.1 (Blinking) → 90.1 iCH (Blinking) → 90.1 iCH (Blinking) → 90.2.</p>

Momentary key	Description												
SEEK UP	<p>The SEEK UP key is used for auto-tuning (seek operation). Pressing the SEEK UP key increases the frequency by one channel space and checks whether there is a broadcasting station at each reception frequency (by a method determined depending on the states of the ENAMIF and ENFMIF initial setting diodes). If a broadcasting station is detected, the seek operation ends. The seek operation performed varies with the state of the AUTOLOC initial setting diode as follows:</p> <p>(1) When AUTOLOC = 0 (with no auto local function): A search operation begins at the frequency currently being received. The search operation continues in local or DX mode whichever has been selected when the search operation starts, until a station is detected.</p> <p>(2) When AUTOLOC = 1 (with an auto local function): A search operation begins at the frequency being currently received in local mode. When all frequencies are searched through in local mode, a search operation is switched to DX mode and continues until a station is detected. If the SEEK UP key is pressed in local mode, DX mode is selected, and a search operation restarts with the same frequency as for the previous search. If the SEEK UP key is pressed during a search in DX mode, the search operation ends, and the frequency at which the search operation began is selected.</p> <p>When using the SEEK UP key, set the AUTO500 initial setting diode to 0. Setting it to 1 disables the SEEK UP key.</p> <p>The SEEK UP key functions during the search operation as follows:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Key</th> <th style="text-align: center;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">SEEK UP</td> <td>When the SEEK UP key is pressed in seek-up mode, the seek operation stops, and the frequency at which the search operation began is selected. VKYSEL	Description																		
0	<p>Pressing the VOL UP key in a mode other than an electronic volume control mode selects volume mode and increases the volume of sound.</p> <p>In an electronic volume control mode selected by the VOL SEL key, pressing the VOL UP key activates the operation corresponding to the selected mode as follows:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin: 10px 0;"> <thead> <tr> <th style="width: 20%;">Mode</th> <th style="width: 80%;">Function</th> </tr> </thead> <tbody> <tr> <td>Volume</td> <td>Increases the main sound volume.</td> </tr> <tr> <td>Bass</td> <td>Increases the bass.</td> </tr> <tr> <td>Treble</td> <td>Increases the treble.</td> </tr> <tr> <td>Balance</td> <td>Emphasizes the sound volume from the right-side speaker.</td> </tr> <tr> <td>Fader</td> <td>Emphasizes the sound volume from the front speaker.</td> </tr> </tbody> </table> <p>Keeping the VOL UP key pressed for at least 0.5 seconds controls the volume continuously.</p> <p>If no key is pressed for at least 3 seconds, the mode previous to the current electronic volume control mode is reselected.</p>	Mode	Function	Volume	Increases the main sound volume.	Bass	Increases the bass.	Treble	Increases the treble.	Balance	Emphasizes the sound volume from the right-side speaker.	Fader	Emphasizes the sound volume from the front speaker.						
Mode	Function																		
Volume	Increases the main sound volume.																		
Bass	Increases the bass.																		
Treble	Increases the treble.																		
Balance	Emphasizes the sound volume from the right-side speaker.																		
Fader	Emphasizes the sound volume from the front speaker.																		
1	<p>The VOL UP key is ineffective. After an electronic volume control mode is selected using the VOL SEL key, the MAN UP key can be used to perform the same adjustment that would be performed using the VOL UP key.</p> <p>Pressing the MAN UP key in a mode other than an electronic volume control mode does not select volume mode. See the descriptions of the MAN UP and MAN DWN keys for details.</p>																		

3. ALARM FUNCTION

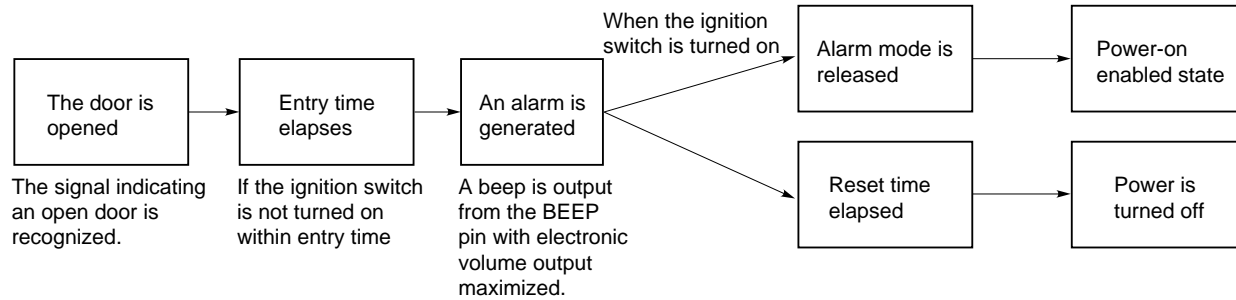

The alarm function is provided as a means of preventing car theft. If the alarm system detects anyone other than the user entering the car, a warning sound is generated.

3.1 Overview of the Alarm Function

- When alarm mode is off

- When alarm mode is on

3.2 Setting Alarm Mode

Alarm mode is set as follows:

Note The time for each status can be set in this stage.

Press and hold down the **P.SCAN** key for two seconds. Then each time the key is pressed, the status changes in the order of the exit time, entry time, reset time, and setting end.

	Initial value (s)	Specificate value (s)
Exit time	12	3 to 180
Entry time	12	3 to 180
Reset time	30	3 to 180

Exit time : Time between opening and closing the door after pressing the **ALARM** key

Entry time : Time between opening the door and turning on the ignition switch

Reset time : Time during which an alarm sound is generated in alarm mode

To set alarm mode, the following pins and keys in (1) to (7) are used.

(1) IGNITION pin

The ignition switch signal is input from the key box.

IGNITION pin	State
At the low level	<ul style="list-style-type: none"> • Power-off • Alarm mode on (alarm being output) and alarm mode time setting enabled • In alarm mode
At the high level	Power-on enabled state

(2) ALARMIN pin

The signal indicating that the car door is open or closed is input.

- When the **ALARM** key has been turned on with the ALARMIN pin at the low level

ALARMIN pin	State
At the low level	The door is closed.
At the high level	The door is open.

- When the **ALARM** key has been turned on with the ALARMIN pin at the high level

ALARMIN pin	State
At the low level	The door is open.
At the high level	The door is closed.

(3) ALARMOUT pin

The state upon warning is output.

This pin is used as a power-on signal for the peripheral hardware, such as an electronic volume control or amplifier.

ALARMIN pin	State
At the low level	Alarm mode off
At the high level	Alarm mode on (alarm being output)

(4) ALARM key

When this key is pressed with both of the following conditions satisfied, the alarm function is activated.

- The ignition switch is off.
- The DISALARM initial setting diode is set to 0.

The **ALARM** key is effective only when the IGNITION pin = 0.

(5) P.SCAN key

When this key is pressed and held down for two seconds or more with both of the following conditions satisfied, the system enters the alarm time setting state.

- The ignition switch is off.
- The DISALARM initial setting diode is set to 0.

(6) MAN UP key

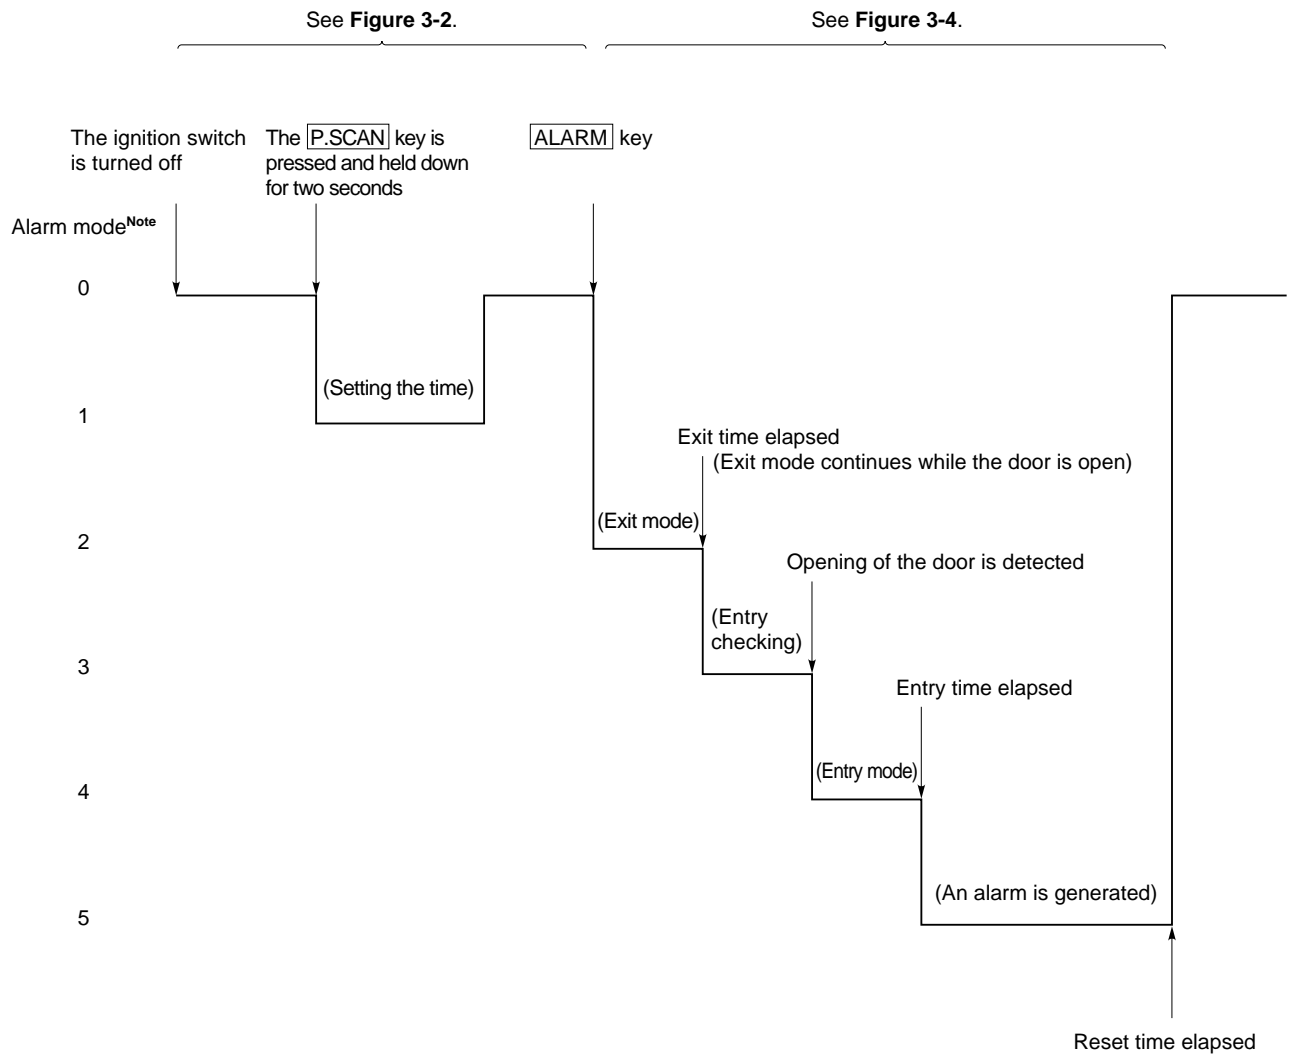

When this key is pressed in the alarm time setting state, the set time is incremented by one step (one second).
When this key is pressed and held down for two seconds or more, the set time is incremented continuously at a rate of one step per 50 ms.

(7) MAN DWN key

When this key is pressed in the alarm time setting state, the set time is decremented by one step (one second).
When this key is pressed and held down for two seconds or more, the set time is decremented continuously at a rate of one step per 50 ms.

Figure 3-1 outlines the setting and operation of alarm mode. Figures 3-2 to 3-4 show the transition of the alarm operations.

Figure 3-1. Outline of Setting and Operation of Alarm Mode

- Note**
- 0: Alarm operation being halted
 - 1: During alarm time setting (setting of the time for exit, entry, and reset)
 - 2: During exit operation
 - 3: During entry checking
 - 4: During entry operation
 - 5: Alarm being generated

Figure 3-2. Transition of Alarm Operations 1 (While Alarm Operation Is Halted)

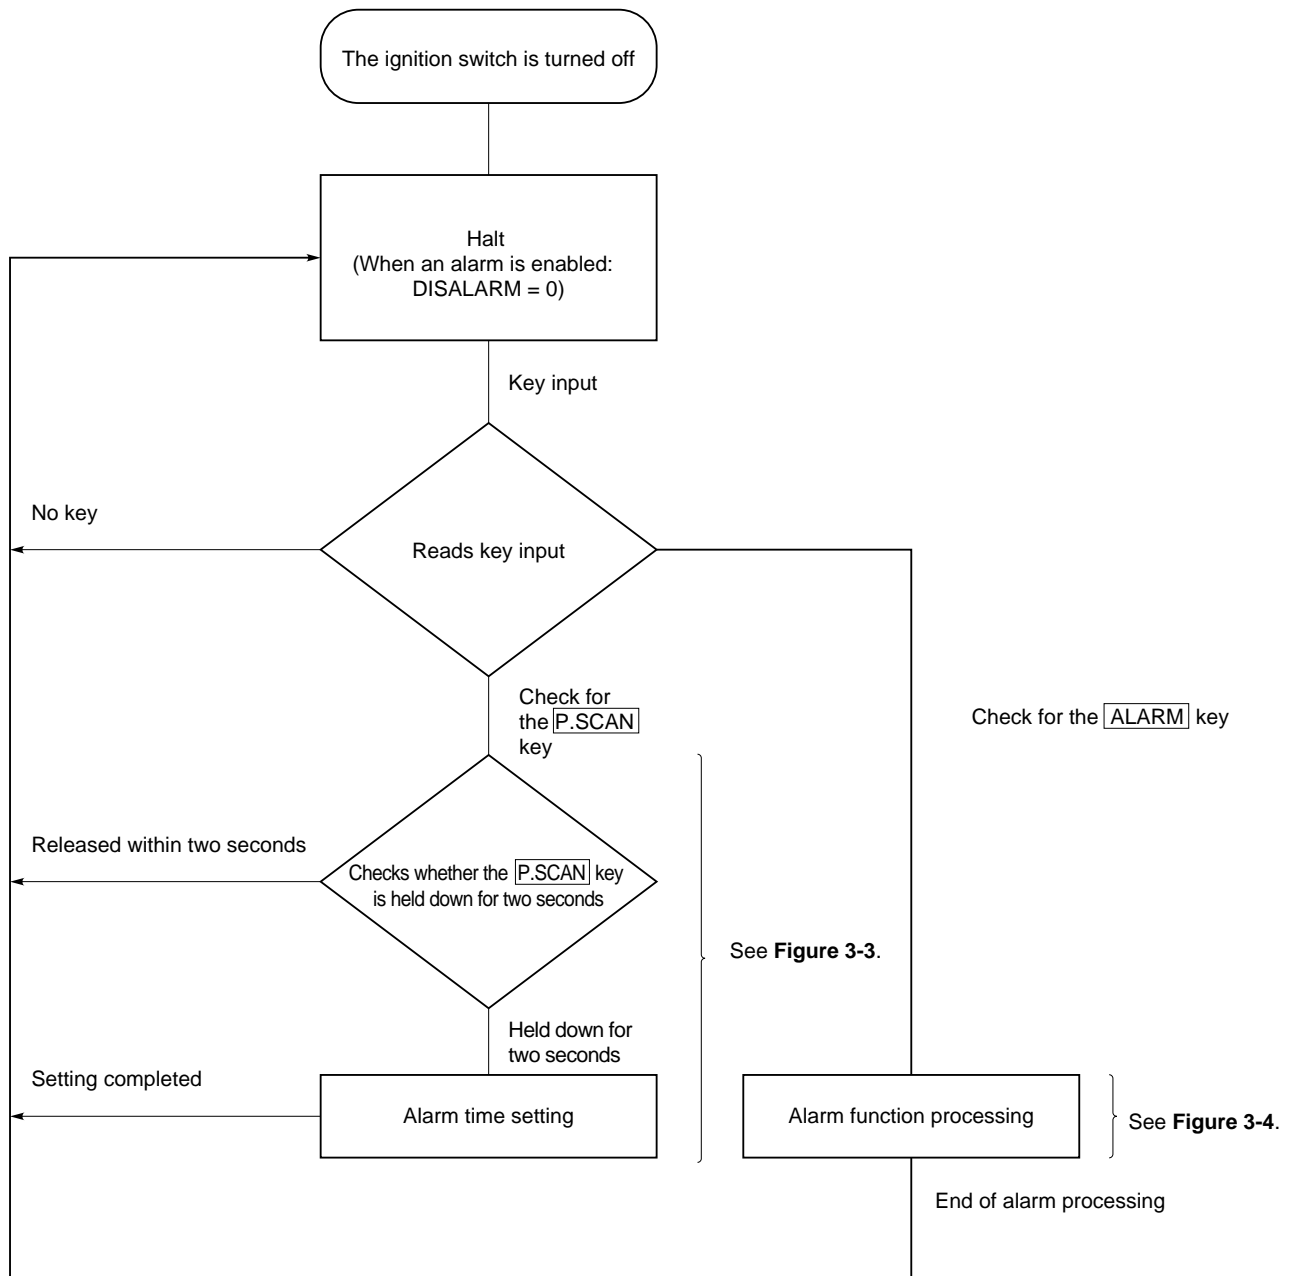

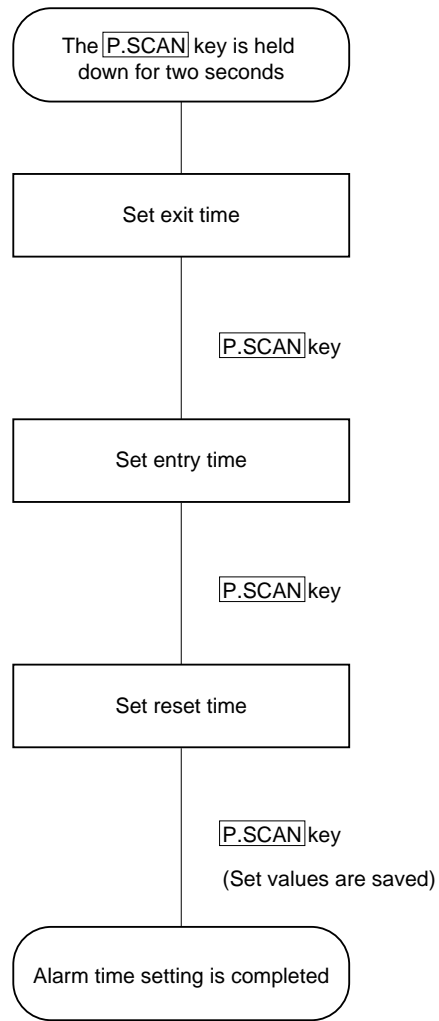

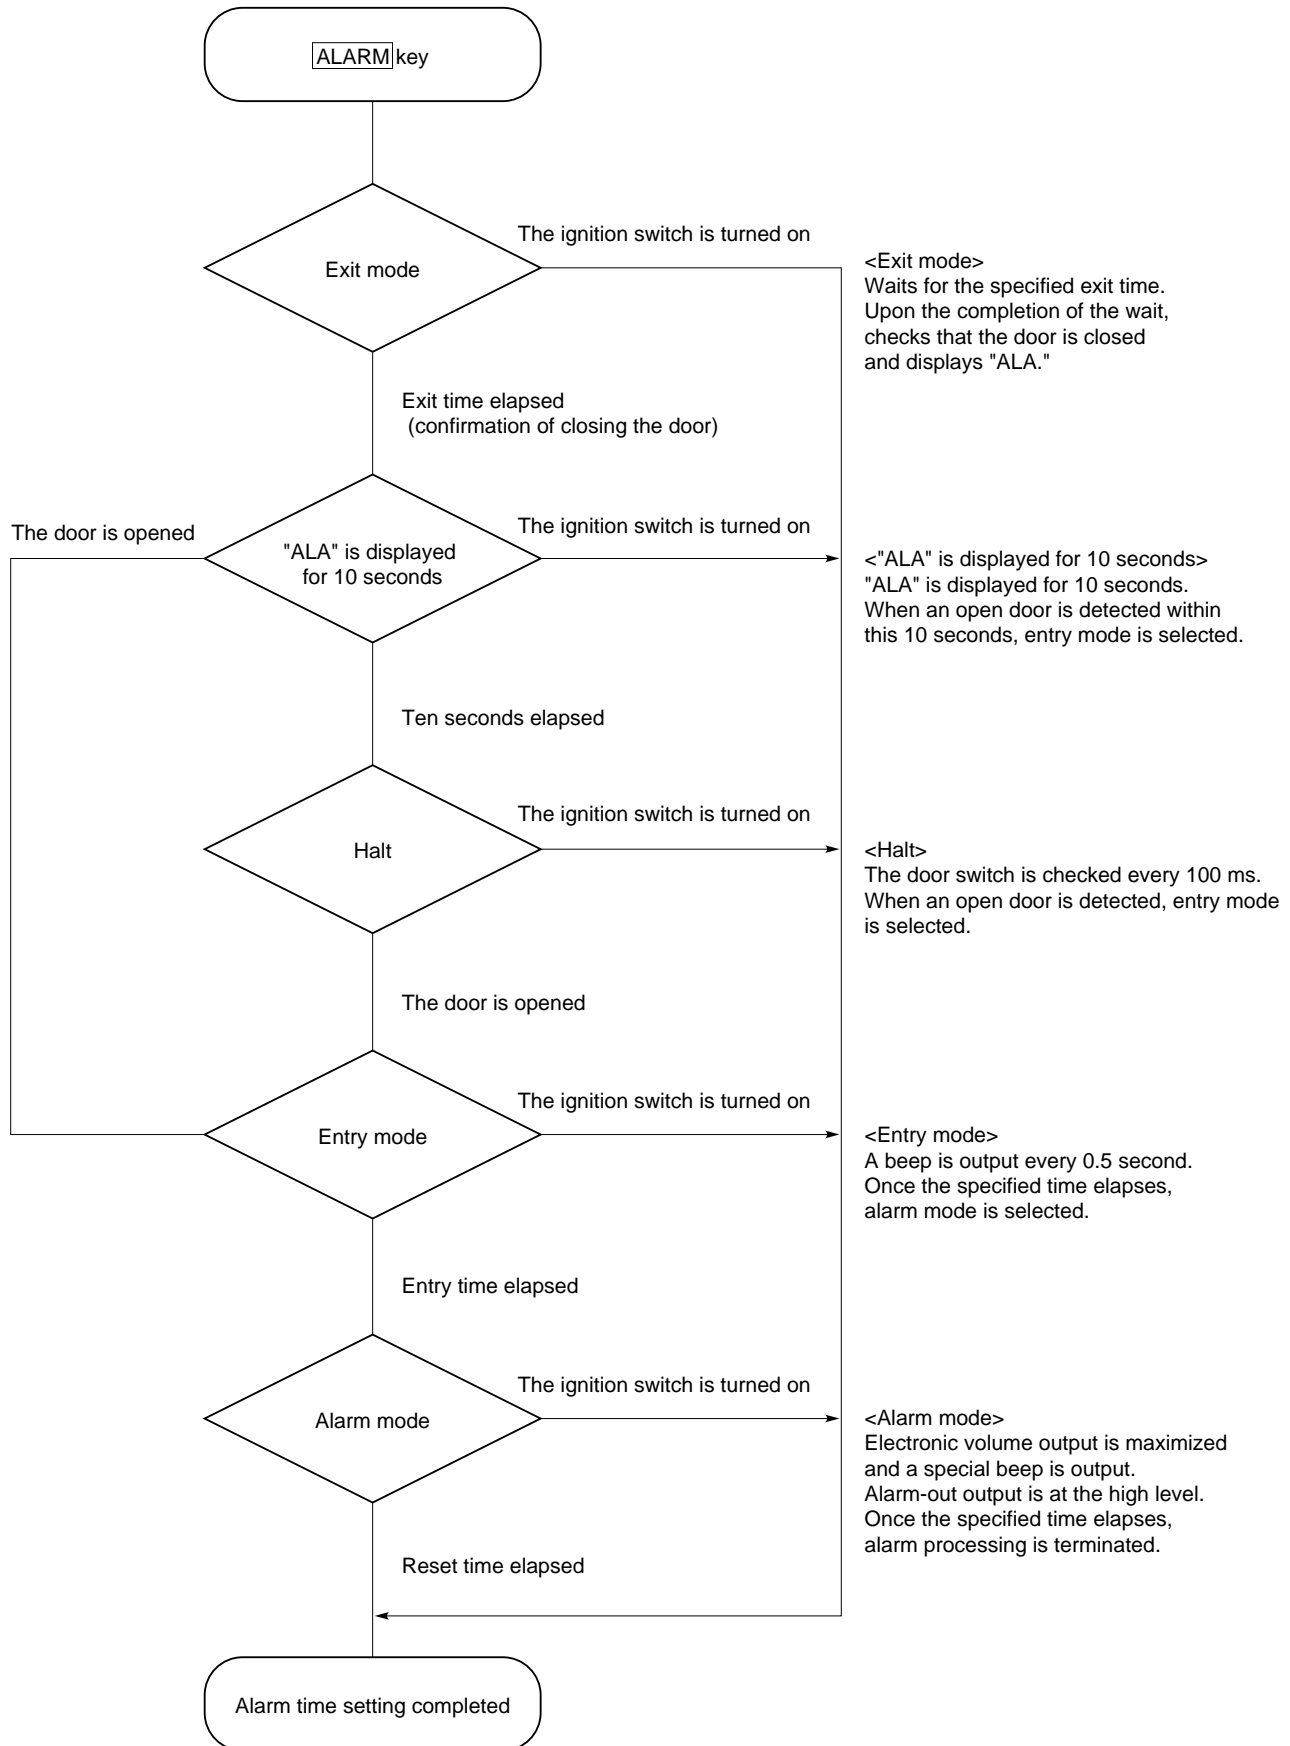

Figure 3-3. Transition of Alarm Operations 2 (Alarm Time Setting)

	Initial value (s)	Specifiable value (s)
Exit time	12	3 to 180
Entry time	12	3 to 180
Reset time	30	3 to 180

Figure 3-4. Transition of Alarm Operations 3 (During Alarm Function Processing)

4. MODE TRANSITION

The radio set is turned on or off by switching the RDSET switch.

The RDSET, TPSET, and CDSET switches are enabled only when the CE and IGNITION pins are high.

When the IGNITION pin is made low, clock display is not provided regardless of state of the initial setting diode NOCLK. However, when NOCLK = 0 (for using the clock), the clock operates.

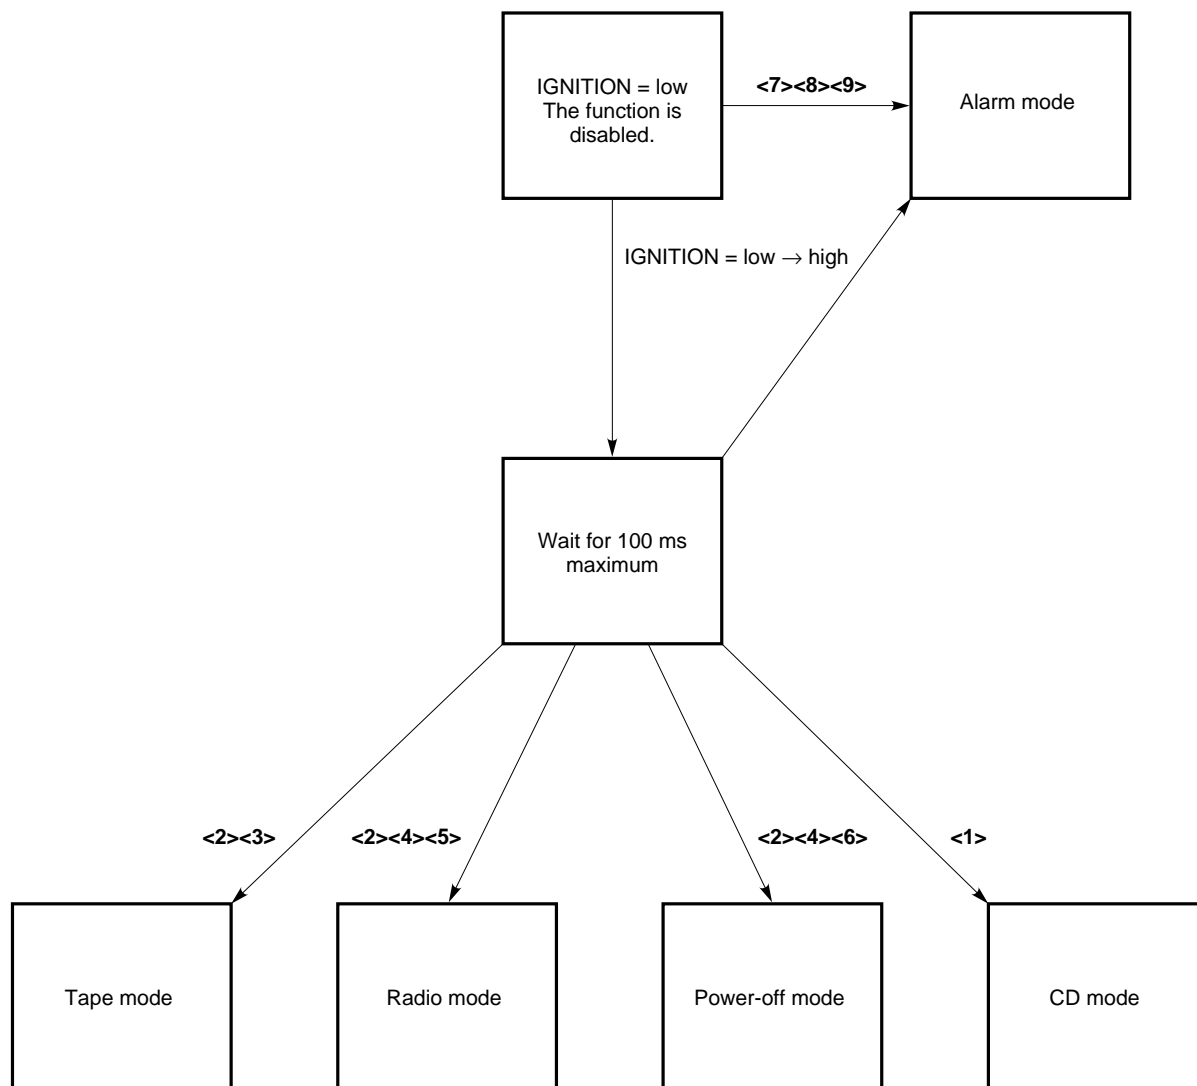

Transition to alarm mode is possible when the IGNITION pin is at a low level.

The CE pin must be fixed to a high level.

(1) Mode transition when the IGNITION pin is raised from low to high

The RDSET switch is used to turn on or off radio mode.

The TPSET and CDSET switches are used to switch to tape mode and CD mode.

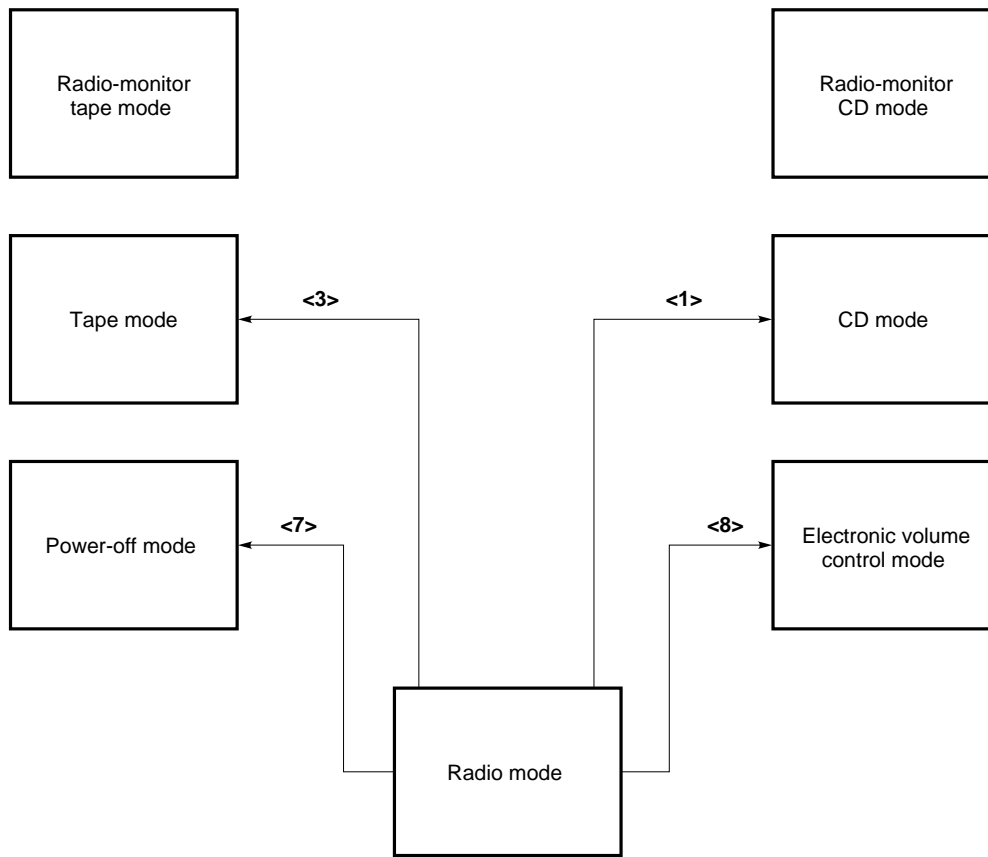

Remark The numbers in brackets (< >) represent the following:

- <1>: CDSET switch on
- <2>: CDSET switch off
- <3>: TPSET switch on
- <4>: TPSET switch off
- <5>: RDSET switch on
- <6>: RDSET switch off
- <7>: IGNITION pin off (low level)
- <8>: ALARM key on
- <9>: DISALARM switch = 0

(2) Mode transition when the IGNITION pin is held high

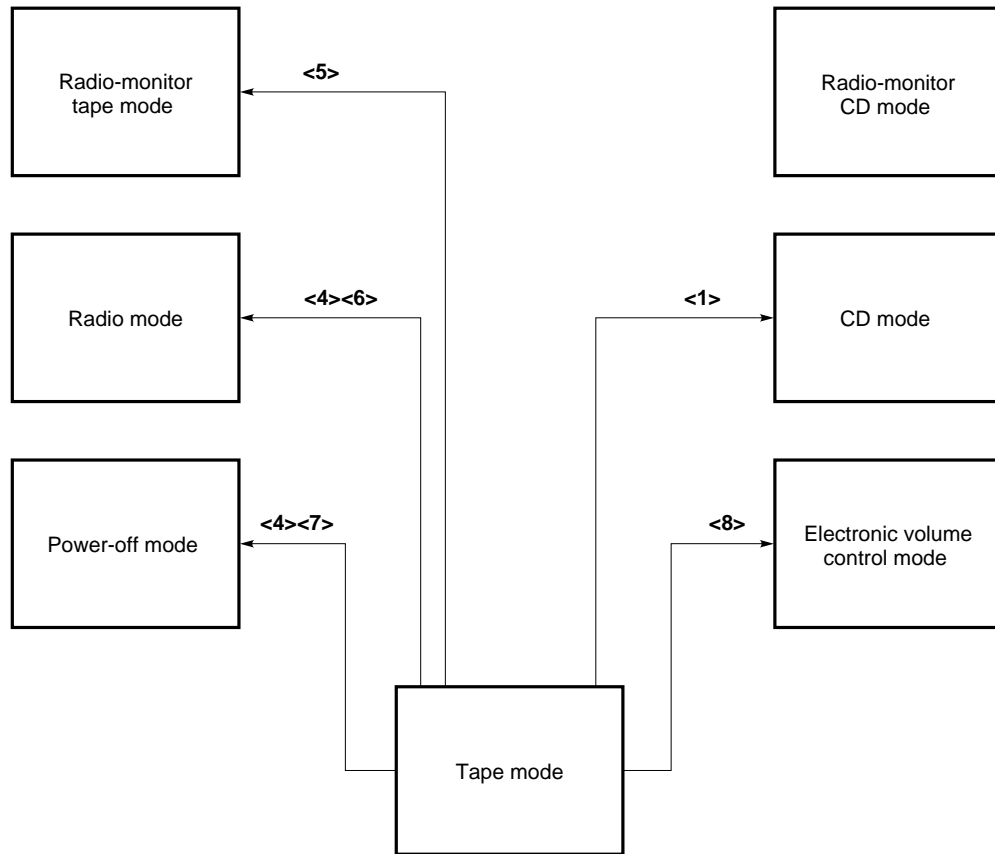

(a) Transition from radio mode to another mode

Remark The numbers in brackets (< >) represent the following:

- | | |
|-----------------------|--|
| <1>: CDSET switch on | <5>: RDMONI key on |
| <2>: CDSET switch off | <6>: RDSET switch on |
| <3>: TPSET switch on | <7>: RDSET switch off |
| <4>: TPSET switch off | <8>: Electronic volume control key on |

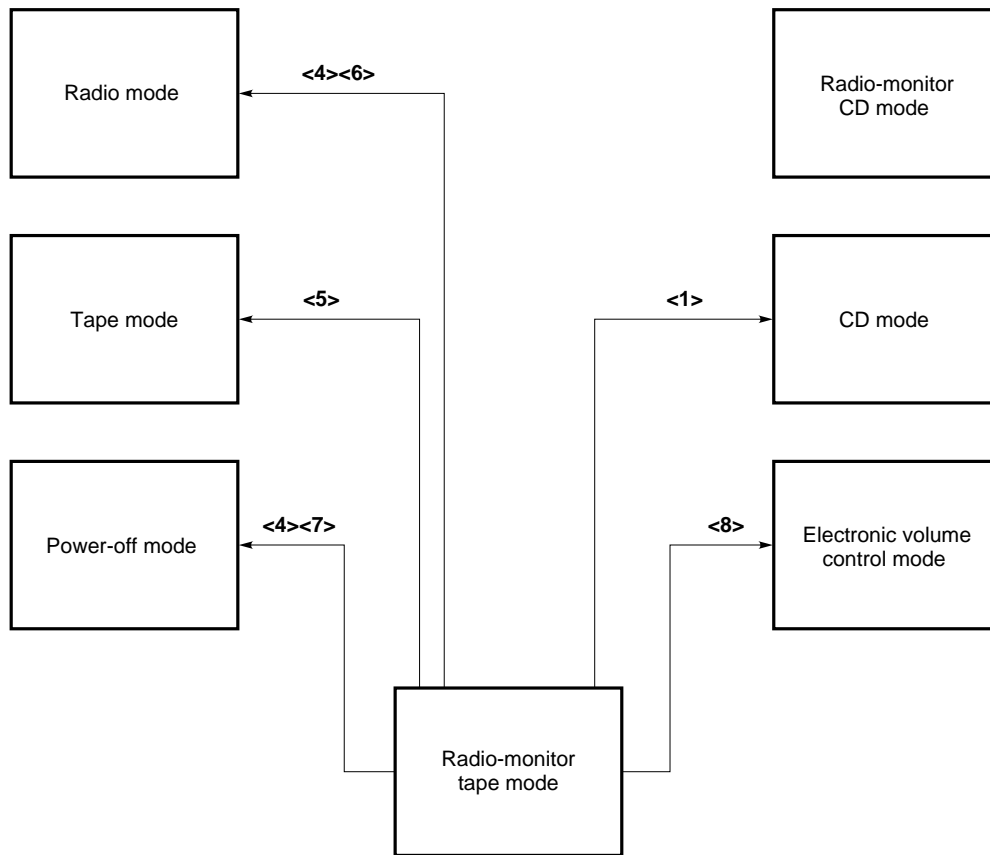

(b) Transition from tape mode to another mode

Remark The numbers in brackets (< >) represent the following:

<1>: CDSET switch on	<5>: RDMONI key on
<2>: CDSET switch off	<6>: RDSET switch on
<3>: TPSET switch on	<7>: RDSET switch off
<4>: TPSET switch off	<8>: Electronic volume control key on

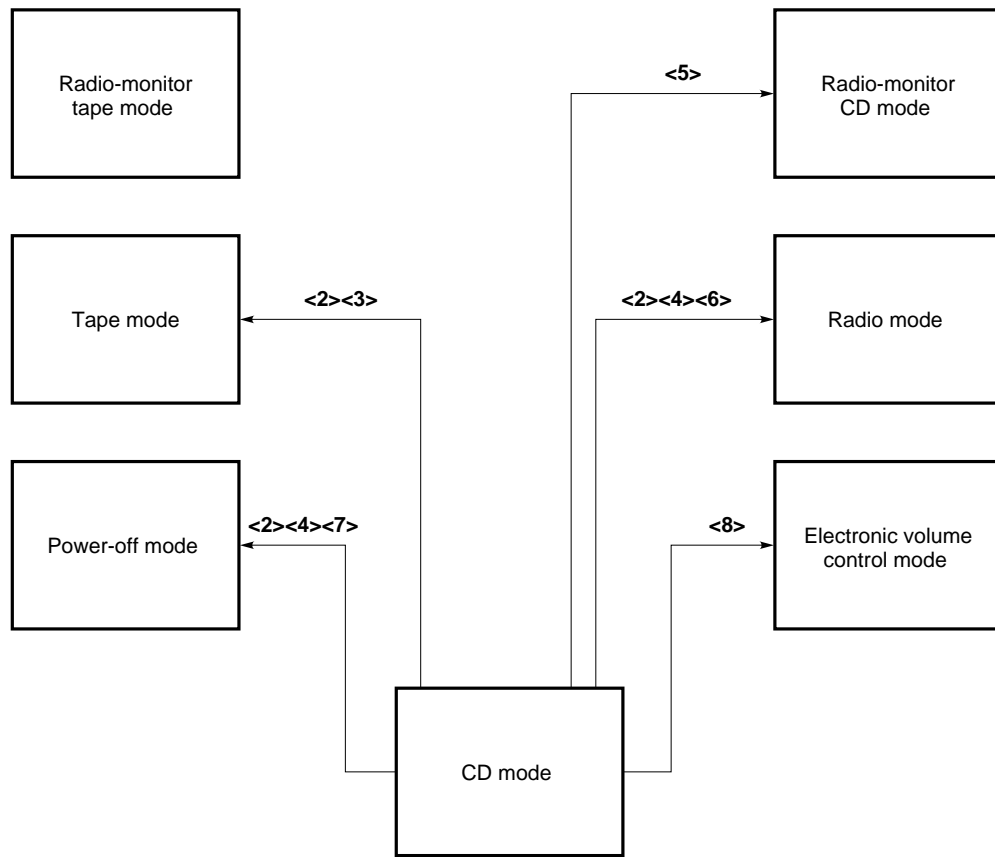

(c) Transition from radio-monitor tape mode to another mode

Remark The numbers in brackets (< >) represent the following:

- <1>: CDSET switch on
- <2>: CDSET switch off
- <3>: TPSET switch on
- <4>: TPSET switch off
- <5>: RDMONI key on
- <6>: RDSET switch on
- <7>: RDSET switch off
- <8>: Electronic volume control key on

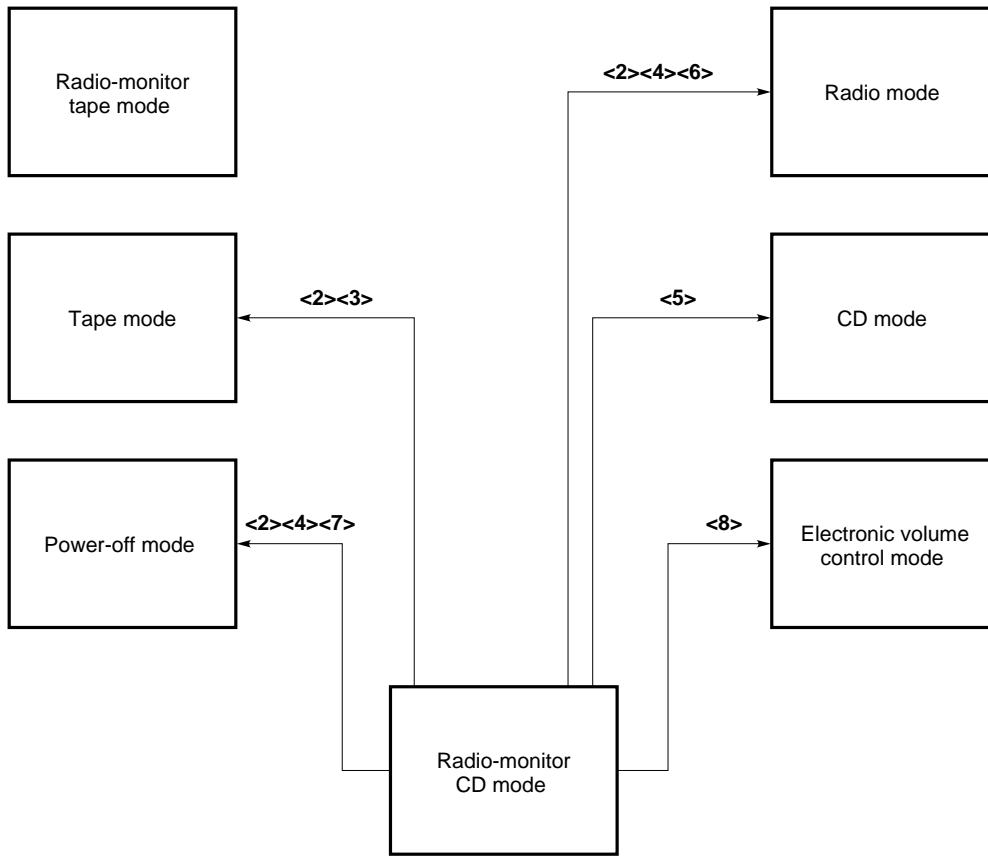

(d) Transition from CD mode to another mode

Remark The numbers in brackets (< >) represent the following:

<1>: CDSET switch on	<5>: RDMONI key on
<2>: CDSET switch off	<6>: RDSET switch on
<3>: TPSET switch on	<7>: RDSET switch off
<4>: TPSET switch off	<8>: Electronic volume control key on

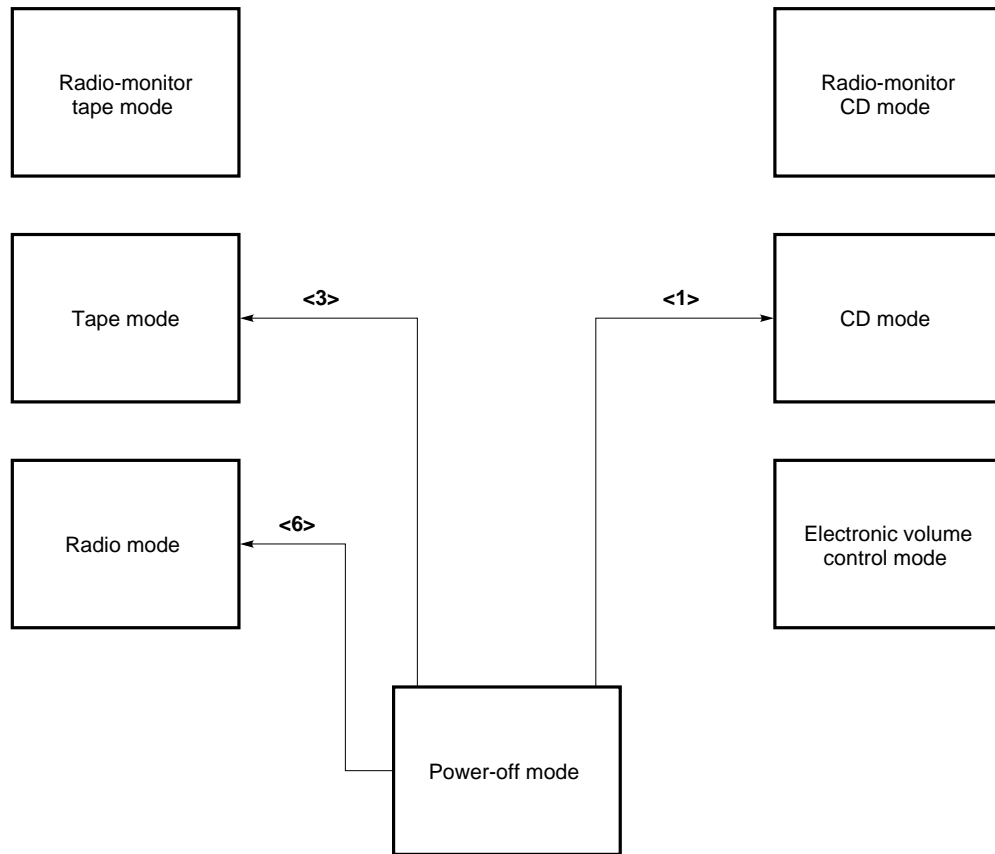

(e) Transition from radio-monitor CD mode to another mode

Remark The numbers in brackets (< >) represent the following:

- | | |
|-----------------------|---|
| <1>: CDSET switch on | <5>: <input type="checkbox"/> RDMONI key on |
| <2>: CDSET switch off | <6>: RDSET switch on |
| <3>: TPSET switch on | <7>: RDSET switch off |
| <4>: TPSET switch off | <8>: Electronic volume control key on |

(f) Transition from power-off mode to another mode

Remark The numbers in brackets (< >) represent the following:

<1>: CDSET switch on	<5>: RDMONI key on
<2>: CDSET switch off	<6>: RDSET switch on
<3>: TPSET switch on	<7>: RDSET switch off
<4>: TPSET switch off	<8>: Electronic volume control key on

5.6 Description of Display

Display	Description
ALARM ARMING EXIT ENTRY RESET	Indicates the state of the alarm operation. <ul style="list-style-type: none"> • ALARM : This indication is on in alarm mode. • ARMING : This indication is on during alarm output. • EXIT : This indication is on during exit time setting. • ENTRY : This indication is on during entry time setting. • RESET : This indication is on during reset time setting.
CLASSIC NORMAL POP ROCK	Indicates the mode for the external sound control IC. <ul style="list-style-type: none"> • CLASSIC: Classic mode • NORMAL: Normal mode • POP : Pops mode • ROCK : Rock mode
ST	Indicates that a stereo broadcast is currently received. <p>(1) In CD mode or tape mode This indication is off.</p> <p>(2) In other modes This indication is on when the FM or MW band is selected, the ST switch is on in the station reception state, and the MONO-off state is set. (For the MW band, this indication is on only when the initial setting diode MWS = 1, and the stereo reception function is enabled.) This indication is off during tuning operation regardless of which band is selected.</p>
LOC	Indicates that the local state is set. <p>(1) In CD mode and tape mode This indication is off.</p> <p>(2) In other modes This indication is on in the local state.</p>
LOUD	Indicates that the loudness-on state is set. This indication is on in the loudness-on state, regardless of which mode is set.
MTL	Indicates that the METAL-on state is set. <p>(1) In tape mode and radio-monitor tape mode This indication is on in the METAL-on state.</p> <p>(2) In other modes This indication is off.</p>
RDMONI	Indicates that the radio-monitor state is set.
MONO	Indicates that the MONO state is set. <p>(1) In CD mode and tape mode This indication is off.</p> <p>(2) In other modes This indication is on when the FM or MW band is selected in the MONO-off state. (For the MW band, this indication is on only when the initial setting diode MWS = 1, and the stereo reception function is enabled.)</p>
	Indicates a tape running direction. <p>(1) In tape mode and radio-monitor tape mode A tape running direction is displayed according to the state of the RL switch. A tape running direction blinks when the FF switch is on.</p> <p>(2) In other modes This indication is off.</p>

Display	Description
FM1 FM2 FM3 MW LW	Indicates a band received. (1) In CD mode and tape mode This indication is off. (2) In other modes The band currently received is displayed.
	Displays a receive frequency, "ATP", "CD", "TAPE", "VOL", "BAS", "TRE", "BR", "FR", and the clock. When the entire panel is blinking while "VOL" is displayed, the mute state is set.
AM PM	Indicates AM (before noon) or PM (after noon) when the 12-hour system is used for display.
	Indicates a preset memory number or electronic volume control value. When a preset memory is written to or called, the preset memory number is displayed together with "CH." In a electronic volume control mode, the value of the volume control is displayed; the "CH" is turned off in this case. This indication is on when a frequency is displayed; this indication is off when the clock is displayed. When preset memory write operation is enabled, "CH" blinks at a frequency of 1 Hz. When a preset memory is being scanned, the preset memory number blinks at a frequency of 1 Hz.

6. REMOTE CONTROL FUNCTION

Use the μPD6121G for sending signals from a remote-controller. The μPD6121G incorporates a custom code. If this code is not correctly set, the μPD17012GF-058 cannot be controlled using the remote controller.

The custom code which operates the μPD17012GF-058 is 8604H. Set the code to 8604H by connecting a diode and a pull-up resistor appropriately on the key matrix of the μPD6121G. (See **Section 6.4.**)

6.1 Remote-Controller Key Placement (When the μPD6121G Is Used)

Input pin (pin number) Output pin (pin number)	KI ₀ (1)	KI ₁ (2)	KI ₂ (3)	KI ₃ (4)
KI/O ₀ (19)	M1	M2	M3	M4
KI/O ₁ (18)	M5	M6	SEEK UP	-
KI/O ₂ (17)	SCAN UP	SCAN DWN	P. SCAN	BAND
KI/O ₃ (16)	MODE	LOC	MONO	POWER
KI/O ₄ (15)	ILLUMINATION	LOUD	-	-
KI/O ₅ (14)	DISP	MAN UP	MAN DWN	-
KI/O ₆ (13)	-	-	MTL	VOL CON
KI/O ₇ (12)	VOL UP	VOL DWN	MUTE	CD

6.2 Remote-Controller Keys

The remote-controller keys operate in the same way as the momentary keys of the μPD17012GF-058.

6.3 Remote-Controller Data Codes

- When each key is pressed independently

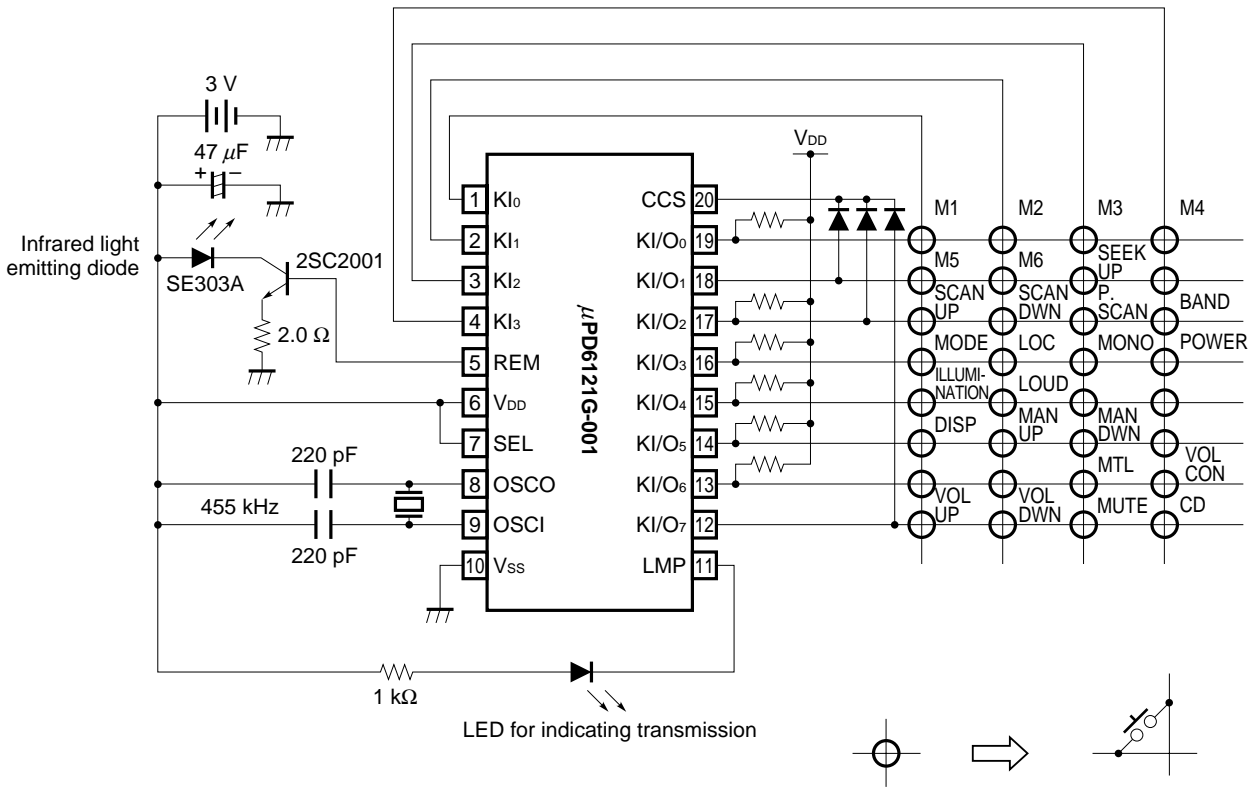

Remote-controller key	Data code							
	D0	D1	D2	D3	D4	D5	D6	D7

6.5 Example of a Remote-Controller Preampfier Circuit Using the μ PC2800HA

7. MUTE OUTPUT TIMING CHARTS

The numbers <1> through <6> in this chapter represent the following:

- <1>: Key-on chattering protection
- <2>: Preceding mute and beep output
- <3>: Updating of the frequency division ratio setting and indication
- <4>: Following mute
- <5>: Scan time
- <6>: Wait for PLL locking

7.1 Radio Mute ($\overline{\text{RDMUTE}}$ Pin) Output Timing Charts

(1) Manual up/down

(a) 1-channel up/down

(i) When AUTO500 switch = 0

(ii) When AUTO500 switch = 1

In either case (i) or case (ii), the time of <4> is 600 ms to 700 ms at the band edges (lowest frequency \rightleftharpoons highest frequency).

(b) Continuous up/down

(i) When AUTO500 switch = 0

At the band edges, the time of <5> is 500 ms, and the time of <4> is 600 ms to 700 ms.

(ii) When AUTO500 switch = 1

The auto-tuning function is enabled by holding down the key for 0.5 second or more, so that continuous up/down operation is not performed.

(2) Automatic up/down

(a) SEEK UP, SCAN UP, or SCAN DWN key

(b) When the MAN UP key is held down for 0.5 second or more when AUTO500 switch = 1

In either case (a) or case (b), the time of <5> is 540 ms at the band edges. An IF check is made twice in the FAST mode and SLOW mode.

(3) Calling a preset memory

(4) Write to a preset memory

Mute output operation is not performed.

(5) Band switching

(6) Turning on or off the radio set

(7) Turning on or off the tape or CD

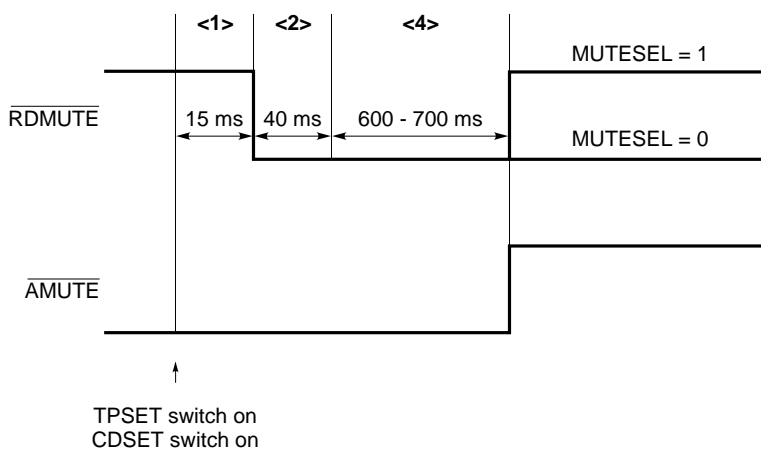

(8) Pulling the CE pin from high to low

Caution When using alarm mode, always pull up the CE pin.

7.2 Radio Mute ($\overline{\text{RDMUTE}}$ Pin) and Audio Mute ($\overline{\text{AMUTE}}$ Pin) Output Timing Charts

(1) When the mode is switched from radio mode to tape or CD mode

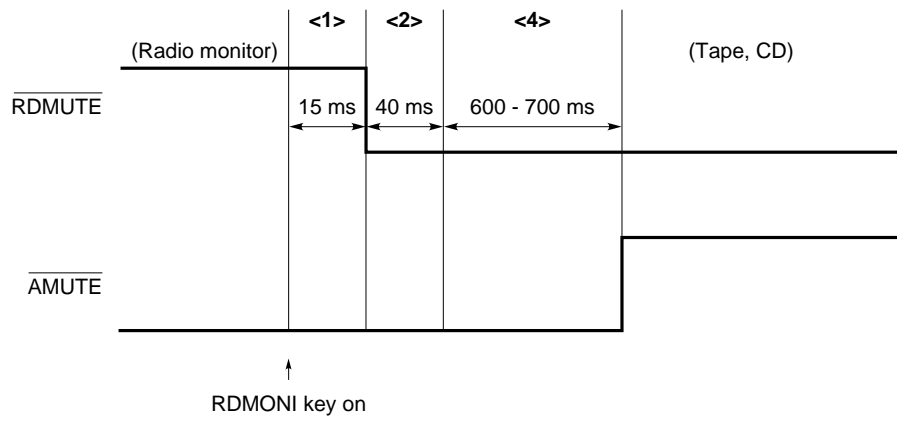

(2) When the radio monitor function is used (Set MUTESEL to 0.)

(a) Switching the radio monitor function from off to on

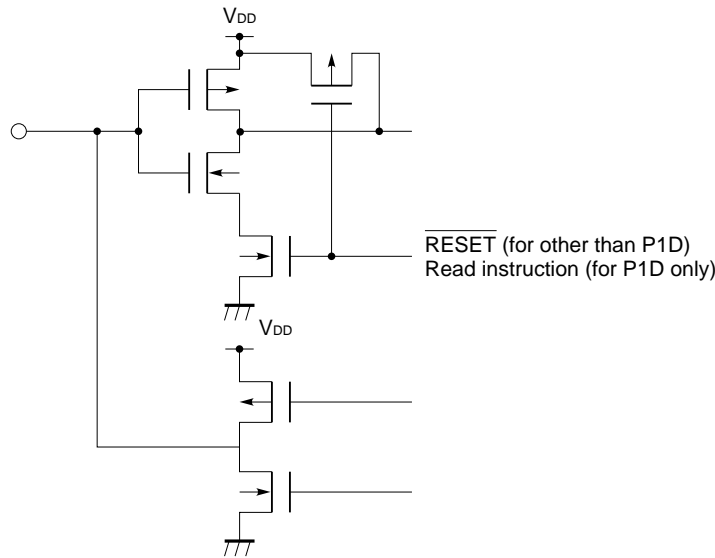

(b) Switching the radio monitor function from on to off

8. PIN I/O CIRCUITS

The I/O circuit of each pin of the μPD17012GF-058 is illustrated below in a simplified form.

- (1) P0A (P0A0/ALARMIN, P0A1/SO1, P0A2/ $\overline{\text{SCK}}$)
 - P0B (P0B1/BEEP, P0B0/IGNITION)
 - P1A (P1A2/MONO, P1A1/EVOL_SCK, P1A0/EVOL_DA)
 - P1D (P1D3/LOUD, P1D2/POWER, P1D1/BAND1, P1D0/BAND2)
- } (I/O)

- (2) P1C (P1C3/AGCC, P1C2/LOC, P1C1/ $\overline{\text{AMUTE}}$, P1C0/ $\overline{\text{RDMUTE}}$)
 - P2H0/POUT, P2G0/ILLUMI, P2E0/ $\overline{\text{LCD CS}}$
 - PYA13/MTL, PYA12/CDOOUT, PYA11/MODE2, PYA10/MODE1,
 - PYA9/KS9-PYA0/KS0
- } (Output)

- (3) P0C (P0C3/ALARMOUT, P0C2/KEYS2 - P0C0/KEYS0) (Output)

(4) P0D (P0D3/K3-P0D0/K0) (Input)

(5) P1B (P1B1/ADC1/KY-IN, P1B0/ADC0/SD) (Input)

(6) P1B (P1B3/FMIFC, P1B2/AMIFC) (Input)

(7) CE
INT/REM } (Schmitt-triggered input)

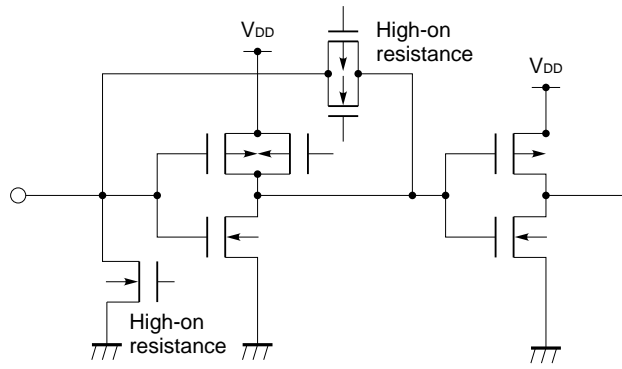

(8) X_{OUT} (Output), X_{IN} (Input)

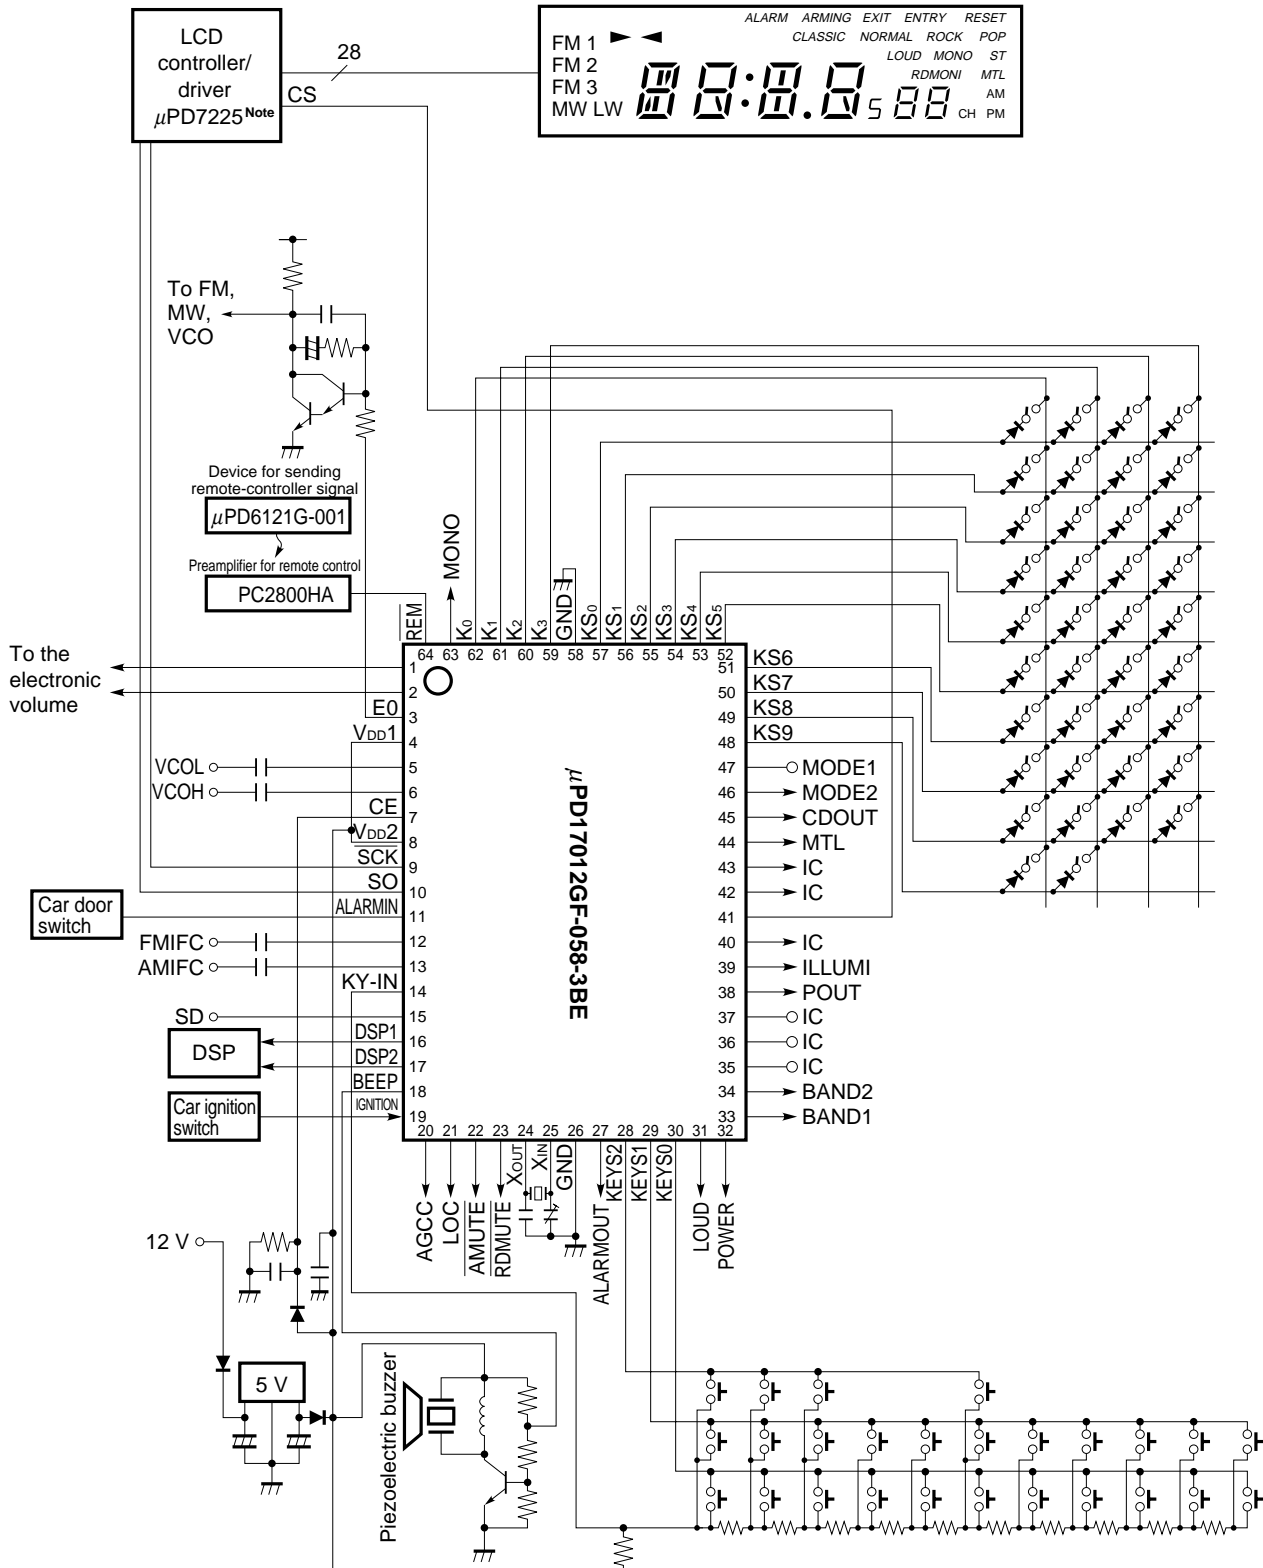

(9) EO (Output)

(10) VCOH } (Input)
VCOL }

9. SAMPLE APPLICATION CIRCUITS

Note When the μPD7225 external LCD controller/driver is used, connect the C/D pin to the VDD pin at the μPD7225.

10. ELECTRICAL CHARACTERISTICS (PRELIMINARY)

ABSOLUTE MAXIMUM RATINGS (T_A = 25 °C)

Parameter	Symbol	Conditions	Rated value	Unit
Supply voltage	V _{DD}		-0.3 to +6.0	V
Input voltage	V _I		-0.3 to V _{DD} + 0.3	V
Output voltage	V _O	Except for P0C0 to P0C3	-0.3 to V _{DD} + 0.3	V
Output high current	I _{OH}	Each pin	-12.0	mA
		Total for all pins	-20.0	mA
Output low current	I _{OL}	Each pin	15.0	mA
		Total for all pins	30.0	mA
Output withstand voltage	V _{BDS}	P0C0 - P0C3	14.0	V
Total loss	P _t		200	mW
Operating ambient temperature	T _A		-40 to +85	°C
Storage temperature	T _{stg}		-55 to +125	°C

Caution Absolute maximum ratings are rated values beyond which physical damage will be caused to the product; if the rated value of any of the parameters in the above table is exceeded, even momentarily, the quality of the product may deteriorate. Always use the product within its rated values.

RECOMMENDED OPERATING RANGES (T_A = -40 to +85 °C)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Supply voltage	V _{DD1}	When the entire chip is operating	4.5	5.0	5.5	V
	V _{DD2}	When the CPU is operating, but the PLL is not	3.5	5.0	5.5	V
Data hold voltage	V _{DDR}	When the crystal oscillator is stopped	2.3		5.5	V
Output withstand voltage	V _{BDS}	P0C0 - P0C3			12.0	V
Rise time of supply voltage	t _{rise}	V _{DD} : 0 → 4.5 V			500	ms

DC CHARACTERISTICS (T_A = -40 to +85 °C, V_{DD} = 5 V ± 10 %)

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
Supply current	I _{DD1}	When the CPU is operating but the PLL is not, with a sinusoidal wave applied to the X _{IN} pin (f _{IN} = 4.5 MHz, V _{IN} = V _{DD})			1.0	2.0	mA
	I _{DD2}	When the CPU is operating but the PLL is not, with a sinusoidal wave applied to the X _{IN} pin (f _{IN} = 4.5 MHz, V _{IN} = V _{DD}) When the HALT instruction is issued			0.5	1.0	mA
Data hold voltage	V _{DDR1}	When the crystal oscillator is operating	With timer FF for interruption detection	3.5			V
	V _{DDR2}	When the crystal oscillator is stopped	With timer FF for interruption detection	2.3			V
	V _{DDR3}		For holding data memory	2.0			V
Data hold current	I _{DDR1}	When the crystal oscillator is stopped	V _{DD} = 5 V, T _A = 25 °C		2.0	4.0	μA
	I _{DDR2}				2.0	20.0	μA
	I _{DDR3}		V _{DD} = 2.3 V, T _A = 25 °C		1.0	2.0	μA
	I _{DDR4}		V _{DD} = 2.3 V		1.0	10.0	μA
Input high voltage	V _{IH1}	P0A1, P0B0 - P0B3, P1A0 - P1A2, P1B0 - P1B3, P1D0 - P1D3		0.7V _{DD}		V _{DD}	V
	V _{IH2}	P0A0, P0A2, CE, INT		0.8V _{DD}		V _{DD}	V
	V _{IH3}	P0D0 - P0D3		0.6V _{DD}		V _{DD}	V
Input low voltage	V _{IL1}	P0A1, P0B0 - P0B3, P0D0 - P0D3, P1A0 - P1A2, P1B0 - P1B3, P1D0 - P1D3				0.2V _{DD}	V
	V _{IL2}	P0A0, P0A2, CE, INT				0.2V _{DD}	V
Output high current	I _{OH1}	P0A0 - P0A2, P0B0 - P0B3, P1A0 - P1A2, P1C0 - P1C3, P1D0 - P1D3 V _{OH} = V _{DD} - 1 V		-1.0			mA
	I _{OH2}	PYA0 - PYA9, PYA11 - PYA15, P2E0, P2F0, P2G0, P2H0, EO V _{OH} = V _{DD} - 1 V		-1.0			mA
Output low current	I _{OL1}	P0A0 - P0A2, P0B0 - P0B3, P1A0 - P1A2, P1C0 - P1C3, P1D0 - P1D3 V _{OL} = 1 V		1.0			mA
	I _{OL2}	PYA0 - PYA9, PYA11 - PYA15, P2E0, P2F0, P2G0, P2H0, EO V _{OL} = 1 V		1.0			mA
	I _{OL3}	P0C0 - P0C3 V _{OL} = 1 V		10			mA
Input high current	I _{IH1}	When the VCOH pin is pulled down V _{IH} = V _{DD}		0.1			mA
	I _{IH2}	When the VCOL pin is pulled down V _{IH} = V _{DD}		0.1			mA
	I _{IH3}	When the X _{IN} pin is pulled down V _{IH} = V _{DD}		0.1			mA
	I _{IH4}	When the P0D0 to P0D3 pins are pulled down V _{IH} = V _{DD}		10		150	μA
Output-off leakage current	I _{L1}	P0C0 - P0C3 V _{OH} = 12 V				1.0	μA
	I _{L2}	EO V _{OH} = V _{DD} , V _{OL} = 0 V				±1.0	μA

AC CHARACTERISTICS (T_A = -40 to +85 °C, V_{DD} = 5 V ± 10 %)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Operating frequency	f _{IN1}	VCOL pin in MF mode, with a sinusoidal wave applied at V _{IN} = 0.15 V _{p-p}	0.90		30	MHz
		VCOL pin in MF mode, with a sinusoidal wave applied at V _{IN} = 0.3 V _{p-p}	0.50		20	MHz
	f _{IN2}	VCOL pin in HF mode, with a sinusoidal wave applied at V _{IN} = 0.15 V _{p-p}	5		25	MHz
		VCOL pin in HF mode, with a sinusoidal wave applied at V _{IN} = 0.3 V _{p-p}	5		40	MHz
	f _{IN3}	VCOH pin in VHF mode, with a sinusoidal wave applied at V _{IN} = 0.15 V _{p-p}	60		130	MHz
		VCOH pin in VHF mode, with a sinusoidal wave applied at V _{IN} = 0.3 V _{p-p}	30		250	MHz
	f _{IN4}	AMIFC FMIFC pin in AMIF count mode, with a sinusoidal wave applied at V _{IN} = 0.3 V _{p-p}	0.3		1.0	MHz
	f _{IN5}	AMIFC pin in AMIF count mode, with a sinusoidal wave applied at V _{IN} = 0.1 V _{p-p}	0.44		0.46	MHz
	f _{IN6}	FMIFC pin in FMIF count mode, with a sinusoidal wave applied at V _{IN} = 0.3 V _{p-p}	5		15	MHz
f _{IN7}	FMIFC pin in FMIF count mode, with a sinusoidal wave applied at V _{IN} = 0.1 V _{p-p}	10.5		10.9	MHz	

A/D CONVERTER CHARACTERISTICS (T_A = -40 to +85 °C, V_{DD} = 5 V ± 10 %)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Resolution of A/D conversion					6	bit
Total error in A/D conversion		T _A = -10 to +50 °C		±1.0	±1.5	LSB

OTHER CHARACTERISTICS (T_A = +25 °C, V_{DD} = 5.0 V, for reference purposes only)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Supply current	I _{DD3}	When the CPU and PLL are operating, with a sinusoidal wave applied to the VCOL pin (f _{IN} = 130 MHz, V _{IN} = 0.3 V _{p-p})		12		mA
	I _{DD4}	When the CPU and PLL are operating, with a sinusoidal wave applied to the VCOH pin (f _{IN} = 250 MHz, V _{IN} = 0.3 V _{p-p})		13		mA

11. PACKAGE DRAWING

64 PIN PLASTIC QFP (14×20)

NOTE

Each lead centerline is located within 0.20 mm (0.008 inch) of its true position (T.P.) at maximum material condition.

S64GF-100-3B8, 3BE-3

12. RECOMMENDED SOLDERING CONDITIONS

The conditions listed below shall be met when soldering the μPD17012GF-058.

For details of the recommended soldering conditions, refer to our document *SMD Surface Mount Technology Manual* (C10535E).

Please consult with our sales offices in case any other soldering process is used, or in case soldering is done under different conditions.

Table 12-1. Soldering Conditions for Surface-Mount Devices

μPD17012GF-058-3BE: 64-pin plastic QFP (14 × 20 mm, 0.1 mm pitch)

Soldering process	Soldering conditions	Symbol
Infrared ray reflow	Peak package's surface temperature: 235 °C Reflow time: 30 seconds or less (at 210 °C or more) Maximum allowable number of reflow processes: 2 Exposure limit ^{Note} : 7 days (20 hours of pre-baking is required at 125 °C afterward.) <Cautions> Non-heat-resistant trays, such as magazine and taping trays, cannot be backed before unpacking.	IR35-207-2
VPS	Peak package's surface temperature: 215 °C Reflow time: 40 seconds or less (at 200 °C or more) Maximum allowable number of reflow processes: 2 Exposure limit ^{Note} : 7 days (20 hours of pre-baking is required at 125 °C afterward.) <Cautions> Non-heat-resistant trays, such as magazine and taping trays, cannot be backed before unpacking.	VP15-207-2
Wave soldering	Temperature in the soldering vessel: 260 °C or less Soldering time: 10 seconds or less Number of soldering processes: 1 Pre-heating temperature: 120 °C max. (package surface temperature) Exposure limit ^{Note} : 7 days (20 hours of pre-baking is required at 125 °C afterward.) <Cautions> Non-heat-resistant trays, such as magazine and taping trays, cannot be backed before unpacking.	WS60-207-1
Partial heating method	Terminal temperature: 300 °C or less Flow time: 3 seconds or less (for each side of device)	-

Note Exposure limit before soldering after dry-pack package is opened.

Storage conditions: Temperature of 25 °C and maximum relative humidity at 65 % or less

Caution Do not apply more than a single process at once, except for "Partial heating method."

APPENDIX COMMUNICATION WITH ELECTRONIC VOLUME CONTROL IC (I²C BUS INTERFACE)

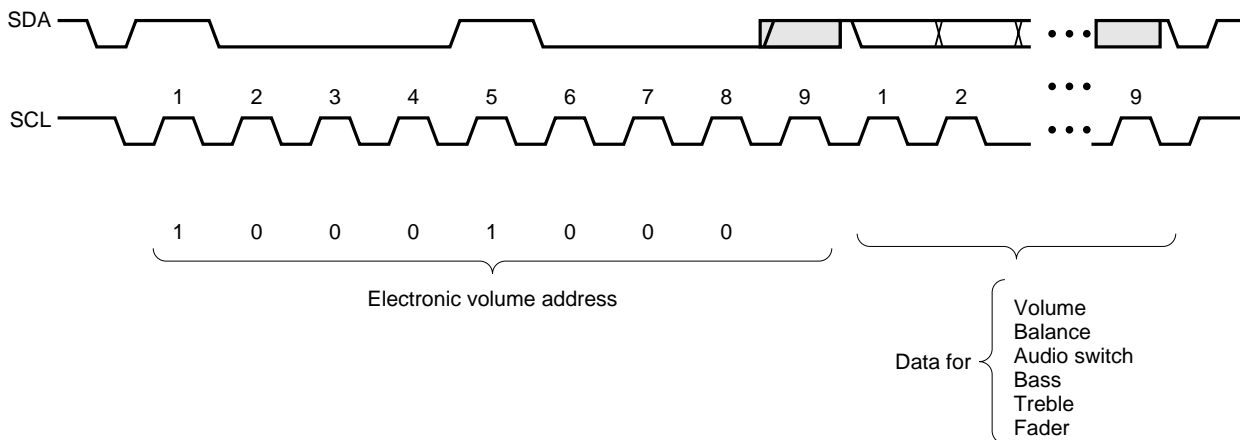

The μPD17012-058 sends specified data, such as volume and balance data, to the electronic volume control IC. Two buses, the data bus and clock bus, are necessary to output data to the electronic volume control IC. Data and clock signals are output from the EVOL_DA pin (pin 2) and EVOL_SCK pin (pin 1) of the μPD17012-058.

Figure A-1. Pin Connections (Electronic Volume Control)

Electronic volume control data consists of nine bits (eight bits for data and a check bit). The electronic volume address (nine bits) and control data (nine bits) are sequentially transferred N times, where N is the number of transferred data items, such as the volume and balance data.

Figure A-2. Data Transfer Format (Electronic Volume Control)

[MEMO]

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

Caution This product contains an I²C bus interface circuit.

When using the I²C bus interface, notify its use to NEC when ordering custom code. NEC can guarantee the following only when the customer informs NEC of the use of the interface:

Purchase of NEC I²C components conveys a license under the Philips I²C Patent Rights to use these components in an I²C system, provided that the system conforms to the I²C Standard Specification as defined by Philips.

The application circuits and their parameters are for reference only and are not intended for use in actual design-ins.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
