MOS INTEGRATED CIRCUIT

μ PD78095B, 78096B, 78098B

8-BIT SINGLE-CHIP MICROCONTROLLERS

DESCRIPTION

The μ PD78095B, 78096B, and 78098B are members of the μ PD78098B Subseries of the 78K/0 Series of microcontrollers.

Compared to the μ PD78094, 78095, and 78098A, EMI (Electro Magnetic Interference) noise is reduced.

Besides a high-speed and high-performance CPU, each microcontroller has various on-chip peripheral hardware such as ROM, RAM, I/O ports, an IEBus™ controller, an 8-bit resolution A/D converter, an 8-bit resolution D/A converter, a timer, serial interface, real-time output port, interrupt control, etc.

A one-time PROM version (μ PD78P098B) that operates in the same power supply voltage as the mask ROM version and various development tools are also provided.

The details of the functions are described in the following user's manuals. Be sure to read them before starting design.

μ PD78098B Subseries User's Manual: U12761E

78K/0 Series User's Manual – Instructions: U12326E

FEATURES

- EMI noise reduced version
- Internal high capacity ROM and RAM

Part Number	Item	Program Memory (ROM)	Internal Data Memory			Package
			High-Speed RAM	Buffer RAM	Expanded RAM	
μ PD78095B	40 Kbytes	1024 bytes	32 bytes	None	2048 bytes	80-pin plastic QFP (14 × 14 mm)
μ PD78096B	48 Kbytes					
μ PD78098B	60 Kbytes					

- External memory expansion space: 64 Kbytes
- Minimum instruction execution time can be varied from high-speed (0.48 μ s) to ultra-low-speed (122 μ s)
- I/O ports: 69 (N-ch open-drain: 4)
- IEBus controller
 - Effective transmission rate: 3.9 kbps/17 kbps/26 kbps
- 8-bit resolution A/D converter: 8 channels
- 8-bit resolution D/A converter: 2 channels
- Serial interface: 3 channels
 - 3-wire serial I/O/SBI/2-wire serial I/O mode: 1 channel
 - 3-wire serial I/O mode: 1 channel
 - 3-wire serial I/O/UART mode: 1 channel
- Timer: 5 channels
- Supply voltage: $V_{DD} = 2.7$ to 5.5 V

APPLICATION FIELDS

Car audio, CD (compact disk) changer, etc.

3. PIN FUNCTIONS

3.1 Port Pins (1/2)

Pin Name	I/O	Function		After Reset	Alternate Function
P00	Input	Port 0 8-bit I/O port	Input only	Input	INTP0/TI00
P01	Input/ Output		Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.	Input	INTP1/TI01
P02					INTP2
P03					INTP3
P04					INTP4
P05					INTP5
P06					INTP6
P07 ^{Note 1}			Input only	Input	XT1
P10 to P17	Input/ Output	Port 1 8-bit input/output port Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software. ^{Note 2}		Input	ANIO to ANI7
P20	Input/ Output		Port 2 8-bit input/output port Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.	Input	SI1
P21					SO1
P22					SCK1
P23					STB
P24					BUSY
P25					SI0/SB0
P26					SO0/SB1
P27					SCK0
P30	Input/ Output		Port 3 8-bit input/output port Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.	Input	TO0
P31					TO1
P32					TO2
P33					TI1
P34					TI2
P35					PCL
P36					BUZ
P37					—
P40 to P47	Input/ Output	Port 4 8-bit input/output port Input/output can be specified in 8-bit units. When used as an input port, on-chip pull-up resistor can be used by software. Test input flag (KRIF) is set to 1 by falling edge detection.		Input	AD0 to AD7

- Notes**
1. When using the P07/XT1 pins as an input port, set 1 to bit 6 (FRG) of the processor clock control register (PCC). Do not use the on-chip feedback resistor of the subsystem clock oscillator.
 2. When using the P10/ANIO to P17/ANI7 pins as the A/D converter analog input, the internal pull-up resistor is automatically disconnected.

3.1 Port Pins (2/2)

Pin Name	I/O	Function		After Reset	Alternate Function
P50 to P57	Input/ Output	Port 5 8-bit input/output port LEDs can be driven directly. Input/output can be specified bit-wise. When used as an input port, on chip pull-up resistor can be used by software.		Input	A8 to A15
P60	Input/ Output	Port 6 8-bit input/output port Input/output can be specified bit-wise.	N-ch open-drain input/output port. On-chip pull-up resistor can be specified by mask option. LED can be driven directly. When used as an input port, on-chip pull-up resistor can be used by software.	Input	—
P61					RD
P62					WR
P63					WAIT
P64					ASTB
P65					SI2/RxD
P66					SO2/TxD
P67					SCK2/ASCK
P70	Input/ Output	Port 7 3-bit input/output port Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.		Input	SI2/RxD
P71					SO2/TxD
P72					SCK2/ASCK
P120 to P123	Input/ Output	Port 12 8-bit input/output port Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.		Input	RTP0 to RTP3
P124					RTP4/TX
P125					RTP5/RX
P126, P127					RTP6, RTP7
P130, P131	Input/ Output	Port 13 2-bit input/output port Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.		Input	ANO0, ANO1

Caution Do not perform the following operations for pins that have alternate functions in addition to port during A/D conversion.

The total error rating may be exceeded with the following operations.

- <1> Rewriting the output latch of a port's output when the pin is used as the port.
- <2> Changing the output level of the pin used for an output when the pin is not used as a port.

3.2 Non-port Pins (1/2)

Pin Name	I/O	Function	After Reset	Alternate Function
INTP0	Input	External interrupt request input by which the active edge (rising edge, falling edge, or both rising and falling edges) can be specified.	Input	P00/TI00

TO1				P31
TO2				P32
PCL	Output	Clock output (for main system clock, subsystem clock trimming)	Input	P35
BUZ	Output	Buzzer output	Input	P36
RTP0 to RTP3	Output	Real-time output port by which data is output in synchronization with a trigger	Input	P120 to P123
RTP4				P124/TX
RTP5				P125/RX
RTP6, RTP7				P126, P127
TX	Output	IEBus controller data output	Input	P124/RTP4
RX	Input	IEBus controller data input	Input	P125/RTP5

3.2 Non-port Pins (2/2)

Pin Name	I/O	Function	After Reset	Alternate Function
AD0 to AD7	Input/ Output	Low-order address/data bus at external memory expansion.	Input	P40 to P47
A8 to A15	Output	High-order address bus at external memory expansion.	Input	P50 to P57
RD	Output	External memory read operation strobe signal output.	Input	P64
WR		External memory write operation strobe signal output.		P65
WAIT	Input	Wait insertion at external memory access.	Input	P66
ASTB	Output	Strobe output which latches the address data output for ports 4 or 5 to access external memory.	Input	P67
AN10 to AN17	Input	A/D converter analog input.	Input	P10 to P17
ANO0, ANO1	Output	D/A converter analog output.	Input	P130, P131
AV _{REF0}	Input	A/D converter reference voltage input.	—	—
AV _{REF1}	Input	D/A converter reference voltage input.	—	—

4. MEMORY SPACE

The memory map of the μ PD78095B, 78096B, and 78098B is shown in Figure 4-1.

Figure 4-1. Memory Map

Notes 1. Only μ PD78098B.

2. When using the external device expansion function with the μ PD78098B, set the internal ROM capacity to below 56 Kbytes by using a memory size switching register (IMS).
3. Internal ROM capacity differs according to the product.

Target Part number	Internal ROM last address nnnnH
μ PD78095B	9FFFFH
μ PD78096B	BFFFFH
μ PD78098B	EFFFH

5. PERIPHERAL HARDWARE FUNCTIONS

5.1 Ports

Input/output ports are classified into three types.

• CMOS input (P00, P07)	: 2
• CMOS input/output (P01 to P06, Ports 1 to 5, P64 to P67, Port 7, Port 12, Port 13)	: 63
• N-ch open-drain input/output (P60-P63)	: 4
Total	: 69

Table 5-1. Functions of Ports

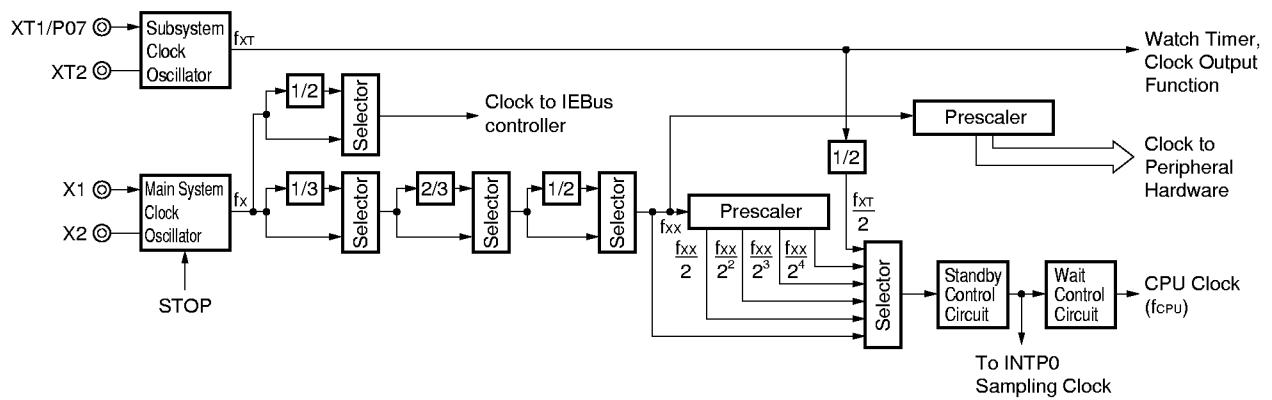

Port Name	Pin Name	Function
Port 0	P00, P07	Input only.
	P01 to P06	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software.
Port 1	P10 to P17	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software.
Port 2	P20 to P27	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software.
Port 3	P30 to P37	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software.
Port 4	P40 to P47	Input/output port. Input/output can be specified in 8-bit units. When used as an input port, on-chip pull-up resistor can be connected by software. The test input flag (KRI) is set to 1 by falling edge detection.
Port 5	P50 to P57	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software. LEDs can be driven directly.
Port 6	P60 to P63	N-ch open-drain input/output port. Input/output can be specified bit-wise. On-chip pull-up resistor can be connected by mask option. LEDs can be driven directly.
	P64 to P67	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software.
Port 7	P70 to P72	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software.
Port 12	P120 to P127	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software.
Port 13	P130, P131	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be connected by software.

5.2 Clock Generator

There are two kinds of clock generators: main system and subsystem clock generators. It is possible to change the minimum instruction execution time.

- $0.5 \mu\text{s}/1.0 \mu\text{s}/2.0 \mu\text{s}/4.0 \mu\text{s}/8.0 \mu\text{s}/16.0 \mu\text{s}$ (@ $f_x = 6.0\text{-MHz}$ operation with main system clock)
- $122 \mu\text{s}$ (@ $f_{XT} = 32.768 \text{ kHz}$ operation with subsystem clock)

5.3 Timer/Event Counter

There are the following five timer/event counter channels:

- 16-bit timer/event counter : 1 channel
- 8-bit timer/event counter : 2 channels
- Watch timer : 1 channel
- Watchdog timer : 1 channel

Table 5-2. Operations of Timer/Event Counters

5.4 Clock Output Control Circuit

This circuit can output clocks of the following frequencies:

- 15.6 kHz/31.3 kHz/62.5 kHz/125 kHz/250 kHz/500 kHz/1.0 MHz/2.0 MHz/4.0 MHz
(@ $f_x = 6.0$ -MHz operation with main system clock)
- 32.768 kHz (@ $f_{xt} = 32.768$ -kHz operation with subsystem clock)

5.6 A/D Converter

The A/D converter consists of eight 8-bit resolution channels.

A/D conversion can be started by the following two methods:

- Hardware starting
- Software starting

Figure 5-8. A/D Converter Block Diagram

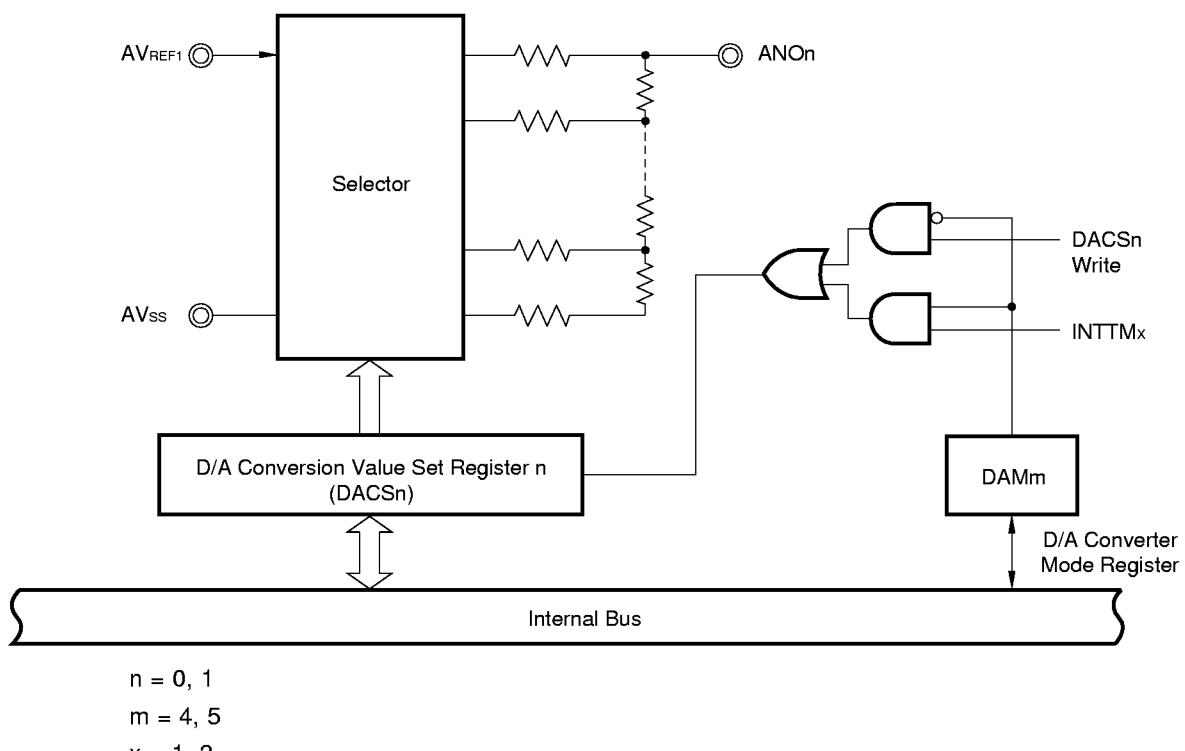

5.7 D/A Converter

The D/A converter consists of two 8-bit resolution channels.

The conversion method is the R-2R resistor ladder method.

5.8 Serial Interfaces

There are the following three on-chip serial interface channels synchronous with the clock:

- Serial interface channel 0
- Serial interface channel 1
- Serial interface channel 2

Table 5-3. Types and Functions of Serial Interfaces

Function	Serial Interface Channel 0	Serial Interface Channel 1	Serial Interface Channel 2

5.9 Real-Time Output Port

Data set previously in the real-time output buffer is transferred to the output latch by hardware concurrently with timer interrupt request or external interrupt request generation in order to output to off-chip. This is a real-time output function. Pins used to output to off-chip are called real-time output ports.

By using a real-time output port, a signal which has no jitter can be output. This is most applicable to control of stepping motors, etc.

5.10 IEBus Controller

IEBus (Inter Equipment Bus™) is a small-scale digital data transmission system for transmitting data between units. When configuring the IEBus with the μ PD78098B Subseries, the IEBus driver/receiver need to be connected externally as they are not incorporated.

Using the IEBus controller incorporated in the μ PD78098B Subseries, positive logic/negative logic can be selected by software for the externally connected IEBus driver/receiver.

6. INTERRUPT FUNCTIONS AND TEST FUNCTIONS

6.1 Interrupt Functions

A total of 23 interrupt sources functions are provided, divided into the following three types.

- Non-maskable : 1
- Maskable : 21
- Software : 1

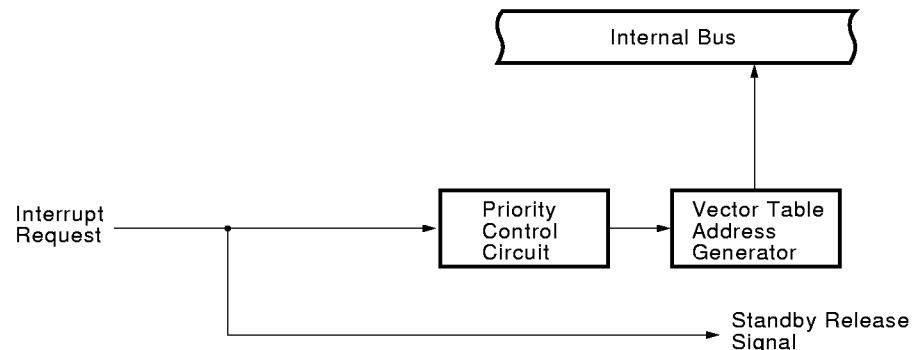

Table 6-1. List of Interrupt Factors

Interrupt Type	Default ^{Note 1} Priority	Interrupt Factor		Internal/ External	Vector Table Address	Basic ^{Note 2} Structure Type
		Name	Trigger			
Non-maskable	—	INTWDT	Overflow of watchdog timer (When watchdog timer mode 1 is selected)	Internal	0004H	(A)
Maskable	0	INTWDT	Overflow of watchdog timer (When the interval timer mode is selected)	Internal	0004H	(B)
	1	INTP0	Pin input edge detection	External	0006H	(C)
	2	INTP1			0008H	(D)

	5	INTP4			000EH	
	6	INTP5			0010H	
	7	INTP6			0012H	
	8	INTCSI0	Completion of serial interface channel 0 transfer	Internal	0014H	(B)
	9	INTCSI1	Completion of serial interface channel 1 transfer		0016H	
	10	INTSER	Occurrence of serial interface channel 2 UART reception error		0018H	
	11	INTSR	Completion of serial interface channel 2 UART reception		001AH	
		INTCSI2	Completion of serial interface channel 2 3-wire transfer		001CH	
	12	INTST	Completion of serial interface channel 2 UART transmission		001EH	
	13	INTTM3	Reference interval signal from watch timer		0020H	
	14	INTTM00	Generation of matching signal of 16-bit timer register and capture/compare register (CR00)		0022H	
	15	INTTM01	Generation of matching signal of 16-bit timer register and capture/compare register (CR01)		0024H	
	16	INTTM1	Generation of matching signal of 8-bit timer/event counter 1		0026H	
	17	INTTM2	Generation of matching signal of 8-bit timer/event counter 2		0028H	
	18	INTAD	Completion of A/D conversion		002AH	
	19	INTIE	Writing data from the IEBus controller to the return code register (RCR) (including the same value) or detecting an IEBus interface runaway.	—	003EH	(E)
Software	—	BRK	Execution of BRK instruction	—	003EH	(E)

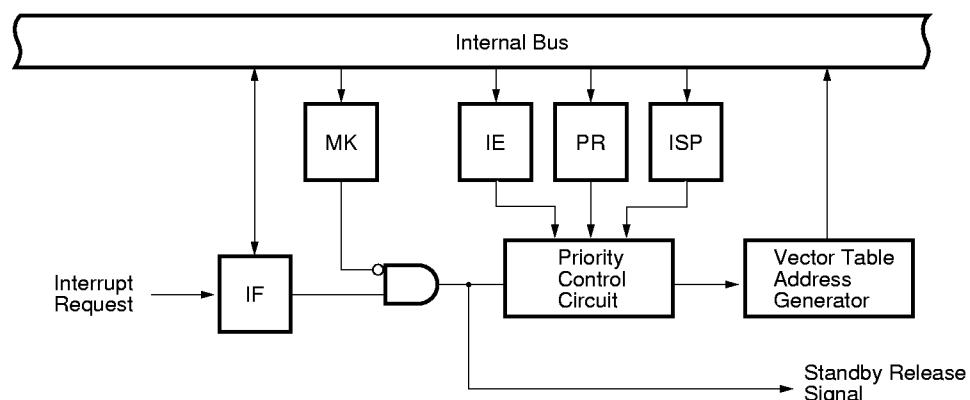

Notes 1. Default priority is the priority order when several maskable interrupt requests are generated at the same time. 0 is the highest order and 19 is the lowest order.
 2. Basic structure types (A) to (E) correspond to (A) to (E) in Figure 6-1.

7. EXTERNAL DEVICE EXPANSION FUNCTIONS

The external device expansion functions connect external devices to areas other than the internal ROM, RAM, and SFR. Ports 4 to 6 are used to connect external devices.

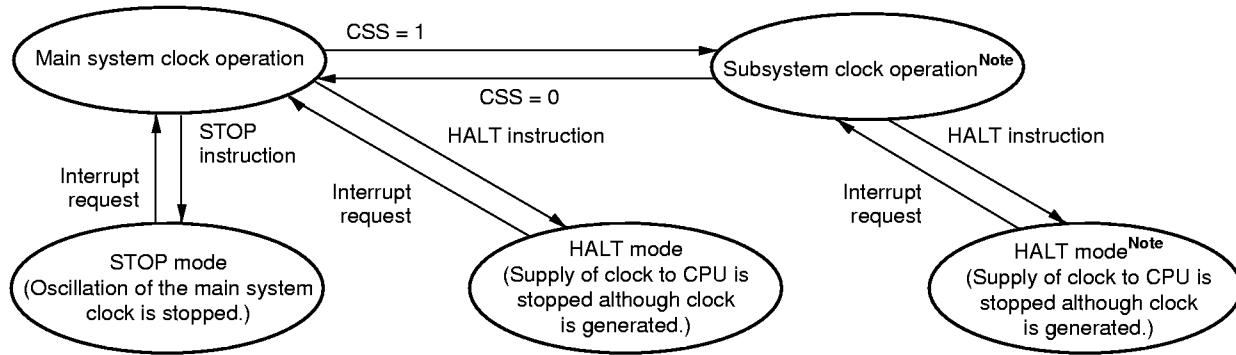

8. STANDBY FUNCTION

The standby function is designed to reduce current consumption.

It has the following two modes:

- HALT mode : In this mode, the CPU operation clock is stopped. The average current consumption can be reduced by intermittent operation by combining this mode with the normal operation mode.
- STOP mode : In this mode, oscillation of the main system clock is stopped. All the operations performed on the main system clock are suspended, and only the subsystem clock is used for extremely small power consumption.

Figure 8-1. Standby Function

Note Current consumption is reduced by shutting off the main system clock. If the CPU is operating on the subsystem clock, shut off the main system clock by setting bit 7 (MCC) of the processor clock control register (PCC). You cannot use a STOP instruction.

Caution When switching on the main system clock again after the subsystem clock has been used with the main system clock stopped, be sure to provide oscillation stabilization time with the program first.

9. RESET FUNCTION

There are the following two reset methods.

- External reset input by RESET pin
- Internal reset by watchdog timer runaway time detection

10. INSTRUCTION SET

(1) 8-bit instructions

Note The r.m.s. value should be calculated as follows: [r.m.s. value] = [Peak value] $\times \sqrt{\text{Duty}}$

Caution Exposure to Absolute Maximum Ratings for extended periods may affect device reliability; exceeding the ratings could cause permanent damage. The parameters apply independently.

Remark Unless otherwise specified, dual-function pin characteristics are the same as port pin characteristics.

Main System Clock Oscillator Characteristics ($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = 2.7$ to 5.5 V)

Resonator	Recommended Circuit	Parameter	Test Conditions	MIN.	TYP.	MAX.	Unit
Ceramic resonator		Oscillation frequency (f_x) ^{Note 1}	$V_{DD} = \text{Oscillation voltage range}$	1.0	6.0	6.29	MHz
		Oscillation stabilization time ^{Note 2}	After V_{DD} came to MIN. of oscillation voltage range			4	ms
Crystal resonator		Oscillation frequency (f_x) ^{Note 1}		1.0	6.0	6.29	MHz
		Oscillation stabilization time ^{Note 2}	$V_{DD} = 4.5$ to 5.5 V			10	ms
						30	
External clock		X1 input frequency (f_x) ^{Note 1}		1.0	6.0	6.29	MHz
		X1 input high- and low-level widths (t_{xH} , t_{xL})	Using at $f_{xx} = f_x$	85		500	ns
			Other than above	72		500	

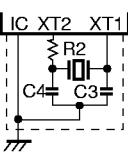

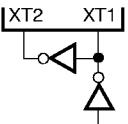

Notes 1. Only the oscillator characteristics are shown. For the instruction execution time, refer to AC Characteristics.
 2. Time required for oscillation to stabilize after a reset or the STOP mode has been released.

Cautions 1. When using the main system clock oscillator, wire the portion enclosed by the dotted line in the figures as follows to avoid adverse influence on the wiring capacitance:

- Keep the wiring length as short as possible.
- Do not cross the wiring over other signal lines.
- Do not route the wiring in the vicinity of lines through which a high fluctuating current flows.
- Always keep the ground point of the capacitor of the oscillator circuit at the same potential as V_{DD} .
- Do not connect a power source pattern through which a high current flows.
- Do not extract signals from the oscillation circuit.

2. When switching on the main system clock again after the subsystem clock has been used with the main system clock stopped, be sure to provide oscillation stabilization time with the program first.

Subsystem Clock Oscillator Characteristics ($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = 2.7$ to 5.5 V)

Resonator	Recommended Circuit	Parameter	Test Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillation frequency (f_{XT}) ^{Note 1}		32	32.768	35	kHz
		Oscillation stabilization time ^{Note 2}	$V_{DD} = 4.5$ to 5.5 V		1.2	2	s
						10	
External clock		XT1 input frequency (f_{XT}) ^{Note 1}		32		100	kHz
		XT1 input high-, low-level widths (t_{XTH} , t_{XTL})		5		15	μ s

Notes 1. Only the oscillator characteristics are shown. For the instruction execution time, refer to AC Characteristics.
 2. Time required for oscillation to stabilize after power (V_{DD}) is turned on.

Cautions 1. When using the subsystem clock oscillator, wire the portion enclosed in dotted line in the figures as follows to avoid adverse influence on the wiring capacitance:

- Keep the wiring length as short as possible.
- Do not cross the wiring over other signal lines.
- Do not route the wiring in the vicinity of lines through which a high fluctuating current flows.
- Always keep the ground point of the capacitor of the oscillator circuit at the same potential as V_{DD} .
- Do not connect a power source pattern through which a high current flows.
- Do not extract signals from the oscillation circuit.

2. The amplification factor of the subsystem clock oscillator circuit is designed to be low to reduce the current consumption and therefore, the subsystem clock circuit is influenced by noise more easily than the main system clock oscillator. When using the subsystem clock, therefore, exercise utmost care in wiring the circuit.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
