

REGULATING PULSE WIDTH MODULATOR

DESCRIPTION

The SG1529 series of pulse width modulator integrated circuits are designed to provide all the operational features of the SG1524B series with the added advantage of an uncommitted input to the PWM comparator. This allows the device to be used in Feed-Forward regulation schemes to achieve better line regulation as well as improved dynamic response. A 5V bandgap reference trimmed to $\pm 1\%$ tolerance, an error amplifier, and a current limit comparator with a high common mode range are included in the I.C.

A DC coupled flip-flop eliminates triggering and glitch problems, and a PWM data latch prevents edge oscillations. The circuit incorporates true digital shutdown for high speed response while an undervoltage lockout circuit prevents spurious outputs when the supply voltage is too low for stable operation. Full double-pulse suppression logic insures alternating output pulses when the Shutdown pin is used for pulse-by-pulse current limiting. The SG1529 is specified for operation over the full military ambient temperature range of -55°C to 125°C. The SG2529 is characterized for the industrial range of -25°C to 85°C and the SG3529 is designed for the commercial range of 0°C to 70°C.

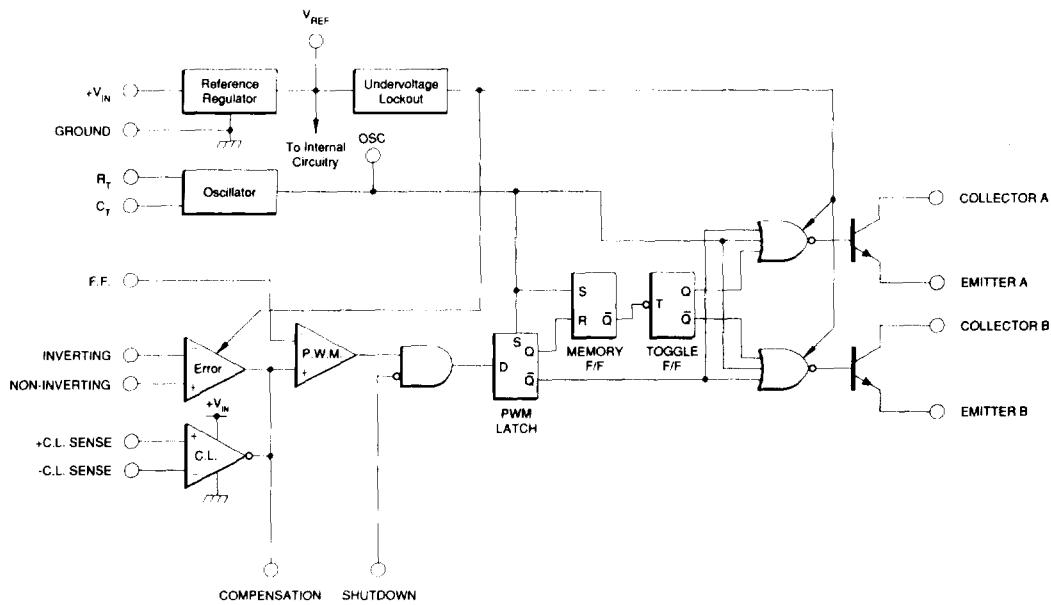

FEATURES

- Feed forward capability
- 7V to 40V operation
- 5V reference trimmed to $\pm 1\%$
- 100Hz to 400KHz oscillator range
- Excellent external sync capability
- Dual 100mA output transistors
- Wide current limit common mode range
- DC-coupled toggle flip-flop
- PWM data latch
- Undervoltage lockout
- Full double-pulse suppression logic
- 60V output collectors

HIGH RELIABILITY FEATURES - SG1529

- ♦ Available to MIL-STD-883
- ♦ SG level "S" processing available

ELECTRICAL SPECIFICATIONS

(Unless otherwise specified, these specifications apply over the operating ambient temperatures for SG1529 with $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$, SG2529 with $-25^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$, SG3529 with $0^\circ\text{C} \leq T_A \leq 70^\circ\text{C}$, and $+V_{IN} = 20\text{V}$. Low duty cycle pulse testing techniques are used which maintains junction and case temperatures equal to the ambient temperature.)

APPLICATION CIRCUITS

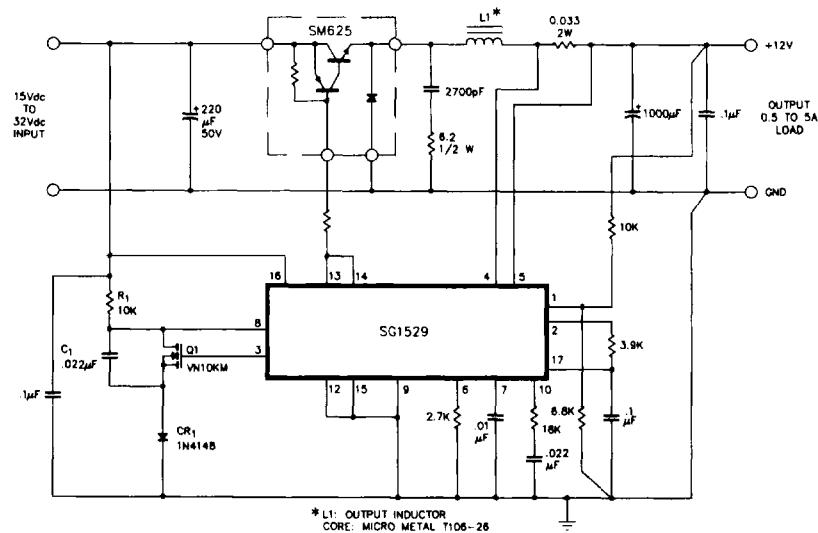

FIGURE 1 - 60W STEP DOWN BUCK CONVERTER

The above schematic describes a 60W step down (Buck) converter where feed forward feature is obtained by generating a ramp with external components R1, C1 and Q1. The slope of the ramp changes with the change in input voltage, which causes the duty cycle to adjust much faster than the conventional fixed slope ramp method resulting in a better line transient response. Rectifier CR1 is used to offset the ramp.
