

Features

- HSDPA /HSUPA /HSPA+/LTE
- Low Voltage Positive Bias Supply (3.0V to 4.2V)
- +28.5dBm Linear Output Power (+27.5dBm HSDPA and HSPA+)
- High Efficiency Operation 47% at $P_{OUT} = +28.5\text{dBm}$
- Low Quiescent Current in Low Power Mode: 5mA when using DC/Dc converter
- Internal Voltage Regulator Eliminates the Need for External Reference Voltage (V_{REF})
- 3-Mode Power States with Digital Control Interface
- Optimized for DC/DC Converter Operation
- Integrated Power Coupler
- Integrated Blocking and Collector Decoupling Capacitors

Applications

- WCDMA/HSDPA/HSPA+/LTE Wireless Handsets and Data Cards
- Dual-Mode UMTS Wireless Handsets

Product Description

The RF7242 is a high-power, high-efficiency, linear power amplifier designed for use as the final RF amplifier in 3V, 50Ω W-CDMA mobile cellular equipment and spread-spectrum systems. This PA is developed for UMTS Band 2 which operates in the 1850MHz to 1910MHz frequency band. The RF7242 has two digital control pins to select one of three power modes to optimize performance and current drain at lower power levels. The part also has an integrated directional coupler which eliminates the need for an external discrete coupler at the output. The RF7242 meets the spectral linearity requirements of High Speed Downlink Packet Access (HSDPA), High Speed Uplink Packet Access (HSUPA), and Long Term Evolution (LTE) data transmission and is assembled in a 10-pin, 3mmx3mm module.

Notes:

- V_{CC} down to 0.5V may be used for backed-off power when using DC/DC converter to conserve battery current.
- For operation at $V_{CC}=3.0V$, derate P_{OUT} by 1.0dB.
- P_{OUT} is specified for 3GPP (Rel99) modulation. For HSPA+ operation, derate P_{OUT} by 1.0dB:
HSPA+ Configuration: 3GPP Rel7 Subtest 1.
- P_{OUT} is specified for 3GPP (HSDPA Sub-test 2 and HSUPA Sub-test 1) modulation.

Pin	Function	Description
1	VBAT	Supply voltage for bias circuitry.
2	RF IN	RF input internally matched to 50 Ω and DC blocked.
3	VMODE1	Digital control input for power mode selection (see Operating Modes truth table).
4	VMODE0	Digital control input for power mode selection (see Operating Modes truth table).
5	VEN	Digital control input for PA enable and disable (see Operating Modes truth table).
6	CPL_OUT	Coupler output.
7	GND	This pin must be grounded.
8	CPL_IN	Coupler input used for cascading couplers in series. Terminate this pin with a 50 Ω resistor if not connected to another coupler.
9	RF OUT	RF output internally matched to 50 Ω and DC blocked.
10	VCC	Supply voltage for the first and second stage amplifier which can be connected to battery supply or output of DC-DC converter.
Pkg Base	GND	Ground connection. The package backside should be soldered to a topside ground pad connecting to the PCB ground plane with multiple ground vias. The pad should have a low thermal resistance and low electrical impedance to the ground plane.

PCB Design Requirements

PCB Surface Finish

The PCB surface finish used for RFMD's qualification process is electroless nickel, immersion gold. Typical thickness is 3µinch to 8µinch gold over 180µinch nickel.

PCB Land Pattern Recommendation

PCB land patterns for RFMD components are based on IPC-7351 standards and RFMD empirical data. The pad pattern shown has been developed and tested for optimized assembly at RFMD. The PCB land pattern has been developed to accommodate lead and package tolerances. Since surface mount processes vary from company to company, careful process development is recommended.

PCB Metal Land Pattern (Top View)

PCB Solder Mask Pattern

Liquid Photo-Imageable (LPI) solder mask is recommended. The solder mask footprint will match what is shown for the PCB metal land pattern with a 2mil to 3mil expansion to accommodate solder mask registration clearance around all pads. The center-grounding pad shall also have a solder mask clearance. Expansion of the pads to create solder mask clearance can be provided in the master data or requested from the PCB fabrication supplier.

Thermal Pad and Via Design

The PCB land pattern has been designed with a thermal pad that matches the die paddle size on the bottom of the device.

Thermal vias are required in the PCB layout to effectively conduct heat away from the package. The via pattern has been designed to address thermal, power dissipation and electrical requirements of the device as well as accommodating routing strategies.

The via pattern used for the RFMD qualification is based on thru-hole vias with 0.203mm to 0.330mm finished hole size on a 0.5mm to 1.2mm grid pattern with 0.025mm plating on via walls. If micro vias are used in a design, it is suggested that the quantity of vias be increased by a 4:1 ratio to achieve similar results.
