

# 128K x 32, 128K x 36, 256K x 18 4 Mb SYNCHRONOUS FLOW-THROUGH STATIC RAM

OCTOBER 2007

## FEATURES

- Internal self-timed write cycle
- Individual Byte Write Control and Global Write
- Clock controlled, registered address, data and control
- Burst sequence control using MODE input
- Three chip enable option for simple depth expansion and address pipelining
- Common data inputs and data outputs
- Auto Power-down during deselect
- Single cycle deselect
- Snooze MODE for reduced-power standby
- Power Supply  
 LF:  $V_{DD} 3.3V \pm 5\%$ ,  $V_{DDQ} 3.3V/2.5V \pm 5\%$   
 VF:  $V_{DD} 2.5V -5\% +10\%$ ,  $V_{DDQ} 2.5V -5\% +10\%$
- JEDEC 100-Pin TQFP, 119-pin PBGA, and 165-pin PBGA packages
- Automotive temperature available
- Lead-free available

## DESCRIPTION

The *ISSI* IS61(64)LF12832A, IS64VF12832A, IS61(64)LF/VF12836A and IS61(64)LF/VF25618A are high-speed, low-power synchronous static RAMs designed to provide burstable, high-performance memory for communication and networking applications. The IS61(64)LF12832A is organized as 131,072 words by 32 bits. The IS61(64)LF/VF12836A is organized as 131,072 words by 36 bits. The IS61(64)LF/VF25618A is organized as 262,144 words by 18 bits. Fabricated with *ISSI's* advanced CMOS technology, the device integrates a 2-bit burst counter, high-speed SRAM core, and high-drive capability outputs into a single monolithic circuit. All synchronous inputs pass through registers controlled by a positive-edge-triggered single clock input.

Write cycles are internally self-timed and are initiated by the rising edge of the clock input. Write cycles can be one to four bytes wide as controlled by the write control inputs.

Separate byte enables allow individual bytes to be written. Byte write operation is performed by using byte write enable ( $\overline{BWE}$ ) input combined with one or more individual byte write signals ( $\overline{BWx}$ ). In addition, Global Write ( $\overline{GW}$ ) is available for writing all bytes at one time, regardless of the byte write controls.

Bursts can be initiated with either  $\overline{ADSP}$  (Address Status Processor) or  $\overline{ADSC}$  (Address Status Cache Controller) input pins. Subsequent burst addresses can be generated internally and controlled by the  $\overline{ADV}$  (burst address advance) input pin.

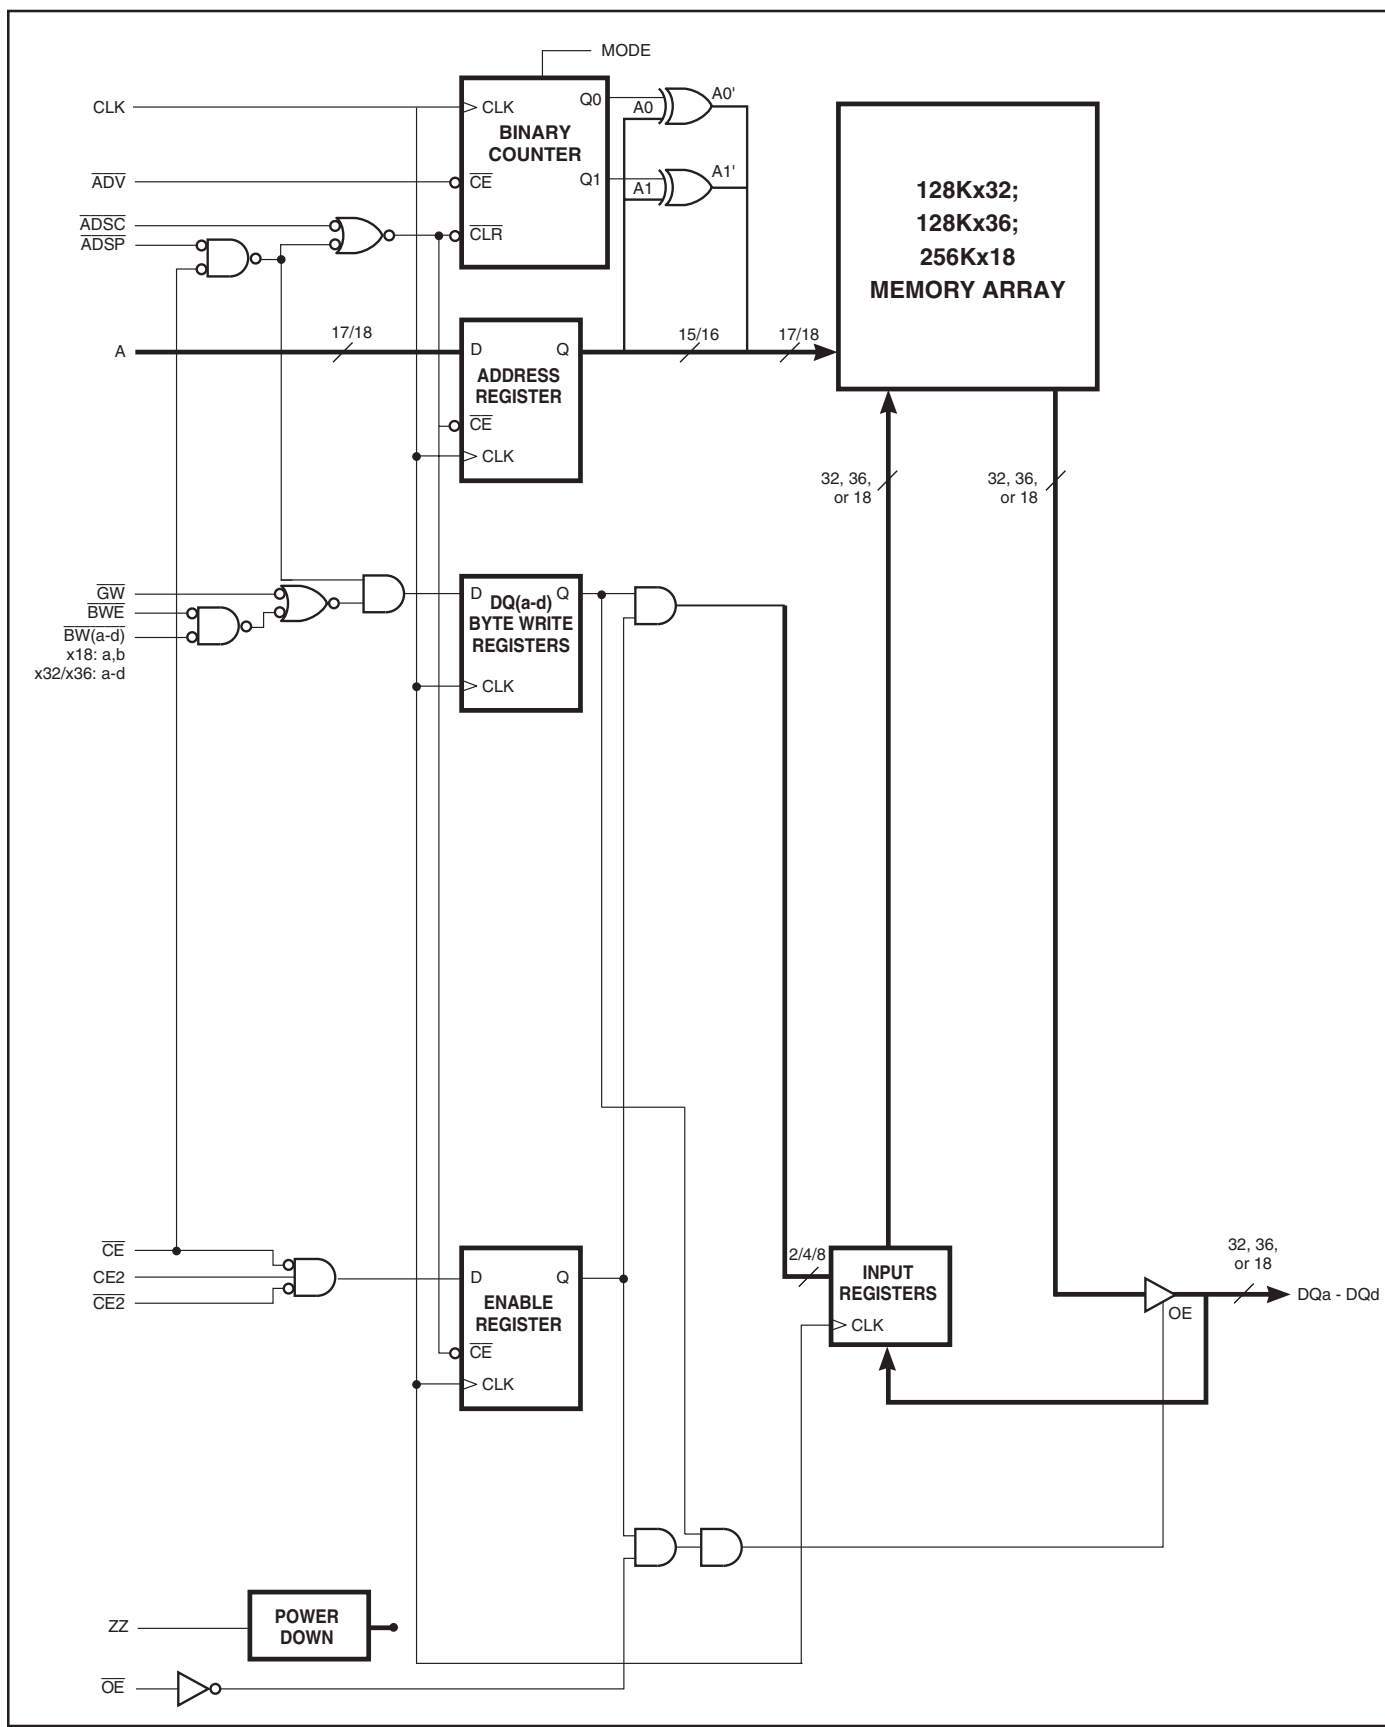

The mode pin is used to select the burst sequence order, Linear burst is achieved when this pin is tied LOW. Interleave burst is achieved when this pin is tied HIGH or left floating.

**NOTE:**

1. X means "Don't Care." H means logic HIGH. L means logic LOW.
2. For **WRITE**, L means one or more byte write enable signals ( $\overline{BWA-d}$ ) and  $\overline{BWE}$  are LOW or  $\overline{GW}$  is LOW. **WRITE** = H for all  $\overline{BWx}$ ,  $\overline{BWE}$ ,  $\overline{GW}$  HIGH.
3.  $\overline{BWA}$  enables WRITES to DQa's and DQPa.  $\overline{BWb}$  enables WRITES to DQb's and DQPb.  $\overline{BWC}$  enables WRITES to DQc's and DQPC.  $\overline{BWD}$  enables WRITES to DQd's and DQPd. DQPa and DQPb are available on the x18 version. DQPa-DQPd are available on the x36 version.
4. All inputs except  $\overline{OE}$  and ZZ must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.
5. Wait states are inserted by suspending burst.
6. For a WRITE operation following a READ operation,  $\overline{OE}$  must be HIGH before the input data setup time and held HIGH during the input data hold time.
7. This device contains circuitry that will ensure the outputs will be in High-Z during power-up.
8.  $\overline{ADSP}$  LOW always initiates an internal READ at the L-H edge of CLK. A WRITE is performed by setting one or more byte write enable signals and  $\overline{BWE}$  LOW or  $\overline{GW}$  LOW for the subsequent L-H edge of CLK. See WRITE timing diagram for clarification.

V <sub>DD</sub>	Voltage on V <sub>DD</sub> Supply Relative to V <sub>SS</sub>	-0.5 to 4.6	V

**Notes:**

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, precautions may be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.
3. This device contains circuitry that will ensure the output devices are in High-Z at power up.
