Spread Spectrum Clock Generator

Features

■ 4 to 32 MHz Input Frequency Range

■ 4 to 128 MHz Output Frequency Range

■ Accepts Clock, Crystal and Resonator Inputs

■ 1x, 2x and 4x Frequency Multiplication

■ Non-modulated Reference Frequency Output

■ Center and Down Spread Modulation

■ Low Power Dissipation
  ❏ 3.3V = 52 mW-typ at 6 MHz
  ❏ 3.3V = 60 mW-typ at 12 MHz
  ❏ 3.3V = 72 mW-typ at 24 MHz

■ Power Down Mode

■ Low Cycle-to Cycle Jitter
  ❏ 8 MHz = 195 ps-typ
  ❏ 16 MHz = 175 ps-typ
  ❏ 32 MHz = 100 ps-typ

■ Available in 16-pin (150-mil.) SOIC package

Applications

■ Printers and MFPs

■ LCD Panels and Monitors

■ Digital Copiers

■ PDAs

■ Automotive

■ CD-ROM, VCD and DVD

■ Networking, LAN/WAN

■ Scanners

■ Modems

■ Embedded Digital Systems

Benefits

■ Peak EMI reduction by 8 to 16dB

■ Fast Time to Market

■ Cost Reduction

General Description

The Cypress CY25568 is a Spread Spectrum Clock Generator (SSCG) IC used for the purpose of reducing Electro Magnetic Interference (EMI) found in today's high-speed digital electronic systems.

The CY25568 uses a Cypress proprietary Phase-Locked Loop (PLL) and Spread Spectrum Clock (SSC) technology to synthesize and modulate the frequency of the digital clock. By frequency modulating the clock, the measured EMI at the fundamental and harmonic frequencies is greatly reduced.

This reduction in radiated energy can significantly reduce the cost of complying with regulatory agency requirements and improve time to market without degrading system performance.

The CY25568 input frequency range is 4 to 32 MHz and accepts clock, crystal, and ceramic resonator inputs. The output clocks can be programmed to produce 1x, 2x, and 4x multiplication of the input frequency with Spread Spectrum. A separate non-modulated reference clock is also provided.

The use of 2x or 4x frequency multiplication eliminates the need for higher order crystals and allows the user to generate up to 128 MHz Spread Spectrum Clock (SSC) by using only first order crystals. This reduces the cost while improving the system clock accuracy, performance and complexity

Center Spread or Down Spread frequency modulation can be selected by the user based on 4 discrete values of Spread % for each Spread Mode with the option of a Non-Spread mode for system test and verification purposes.

The CY25568 is available in a 16 pin SOIC (150-mil.) package with a commercial operating temperature range of 0 to 70°C. Contact Cypress for availability of -25 to +85°C Industrial Temperature Range Operation. Refer to CY25811/12/14 products for 8-pin SOIC package versions of the CY25568.

Input Frequency Range and Selection

The CY25568 input frequency range is 4 to 32 MHz. This range is divided into 3 segments and controlled by 3-Level FRSEL pin as given in Table 1.

Table 1. Input Frequency Selection

FRSEL	INPUT FREQUENCY RANGE
0	4.0 to 8.0 MHz
1	8.0 to 16.0 MHz
M	16.0 to 32.0 MHz

Output Clocks

The CY25568 provides 4 separate output clocks, REFOUT, SSCLK1, SSCLK2 and SSCLK3, for use in a wide variety of applications. Each clock output is described in detail.

REFOUT

REFOUT is a 3.3-volt CMOS level non-modulated copy of the clock at XIN/CLKIN.

SSCLK1, 2 and 3

SSCLK1, SSCLK2 and SSCLK3 are Spread Spectrum clock outputs used for the purpose of reducing EMI in digital systems. Each clock can drive separate nets with a capacitive load of up to 20 pF.

The frequency function of these clock outputs are selected by using 3-Level D0 and D1 digital inputs and are given in Table 2.

Table 2. Output Clocks Function Selection

D0	D1	REFOUT	SSCLK1	SSCLK2	SSCLK3
0	0	REF	REF	1x	1x
0	M	REF	1x	2x	2x
0	1	REF	REF	2x	2x
M	0	REF	REF	1x	2x
M	M	REF	REF	REF	REF
M	1	REF	REF	2x	4x
1	0	REF	REF	4x	4x
1	M	REF	1x	2x	4x
1	1	REF	1x	2x	4x

REF is the same non-modulated frequency as the input clock.

1x, 2x, or 4x are modulated and multiplied (in the case of 2x and 4x) frequency of the input clock.

Spread % Selection

The CY25568 provides Center-Spread, Down-Spread and No-Spread functions. These functions and the amount of Spread % are selected by using 3-Level S0 and S1 digital inputs and are given in Table 3.

3-Level Digital Inputs

Figure 2. 3-Level Logic
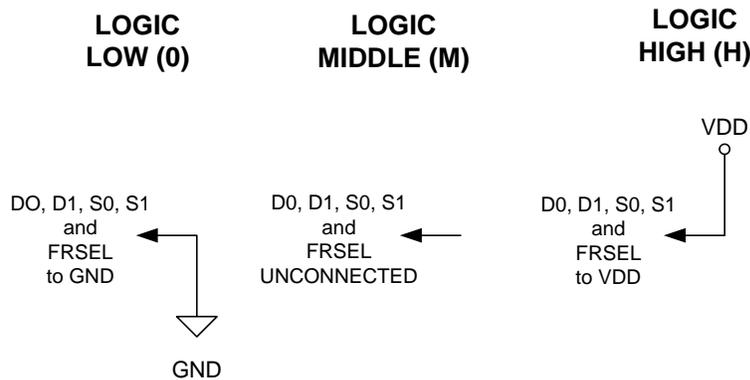

S0, S1, D0, D1, and FRSEL digital inputs of the CY25568 are designed to sense 3 different logic levels designated as High "1", Low "0" and Middle "M". With this 3-Level digital input logic, the CY25568 is able to detect 9 different logic states in the case of (S0, S1) and (D0, D1) logic pairs and 3 different logic states in the case of FRSEL.

S0, S1, D0, D1, and FRSEL pins include an on chip 20K (10K /10K) resistor divider. No external application resistors are needed to implement the 3-Level logic levels as shown in the following:

Logic State "0" = 3-Level logic pin connected to GND.

Logic State "M" = 3-Level logic pin left floating (no connection).

Logic State "1" = 3-Level logic pin connected to VDD.

Figure 2 illustrates how to implement 3-Level Logic.

Power Down (PD#)

CY25568 includes a Power Down (PD#, Pin 10) function. This input uses standard 2-Level CMOS logic and is internally pulled up to VDD (HIGH). Connect this pin to GND if power is to be turned off.

Modulation Rate

Spread Spectrum Clock Generators use frequency modulation (FM) to distribute energy over a specific band of frequencies. The maximum frequency of the clock (fmax) and minimum frequency of the clock (fmin) determine this band of frequencies. The time required to transition from fmin to fmax and back to fmin is the period of the Modulation Rate, Tmod. The Modulation Rate of SSCG clocks are generally referred to in terms of frequency or fmod = 1/Tmod.

The input clock frequency, fin, and the internal divider determine the Modulation Rate.

In the case of CY25568, the (Spread Spectrum) Modulation Rate is given by the following formula: fmod = fin/DR

Where; fmod is the Modulation Rate, fin is the Input Frequency and DR is the Divider Ratio as given in Table 4. Notice that Input Frequency Range is set by FRSEL.

Table 4. Modulation Rate

FRSEL	INPUT FREQUENCY RANGE (MHz)	DIVIDER RATIO (DR)
0	4 to 8	128
1	8 to 16	256
M	16 to 32	512

Characteristic Curves

The following curves demonstrate the characteristic behavior of the CY25568 when tested over a number of environmental and application specific parameters. These are typical performance curves and are not meant to replace any parameter specified in tables "DC Electrical Characteristics" on page 3 and "Timing Electrical Characteristics" on page 3.

SSCG Profiles

The CY25568 uses a non-linear frequency profile as shown in Figure 7. The use of Cypress proprietary "optimized" frequency profile maintains flat energy distribution over the fundamental and higher order harmonics. This results in additional EMI reduction in electronic systems.
