

LOW DROP VOLTAGE REGULATOR

PRODUCT PREVIEW

- OPERATING DC SUPPLY VOLTAGE RANGE 6V TO 31V
- TRANSIENT SUPPLY VOLTAGE UP TO 40V
- LOW QUIESCENT CURRENT CONSUMPTION LESS THAN 20 μ A WITH ENABLE LOW
- HIGH PRECISION OUTPUT VOLTAGE (2%)
- LOW DROPOUT VOLTAGE LESS THAN 0.5V
- RESET CIRCUIT SENSING THE OUTPUT VOLTAGE DOWN TO 1V
- PROGRAMMABLE RESET PULSE DELAY WITH EXTERNAL CAPACITOR
- WATCHDOG
- PROGRAMMABLE WATCHDOG TIMER WITH EXTERNAL CAPACITOR
- THERMAL SHUTDOWN AND SHORT CIRCUIT PROTECTION
- WIDE TEMPERATURE RANGE ($T_j = -40^{\circ}\text{C}$ TO 150°C)

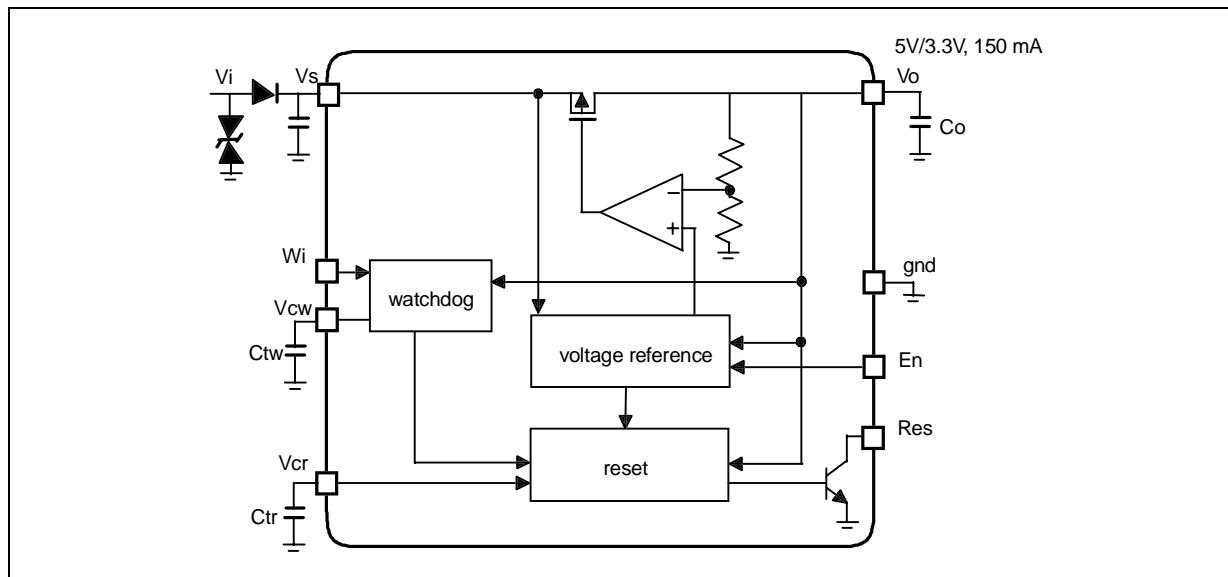

required for stability (above or equal to 100nF). Maximum quiescent current is 20 μ A at all output current equal 0 and enable low. Typical quiescent current is 1.5mA at output current equal to 5mA, 3mA at output current equal to 150mA, and drops to 10mA in "not enabled" mode. On chip trimming results in high output voltage accuracy (2%). Accuracy is kept over wide temperature range, line variation, load variation. The maximum input voltage is 40V. The maximum output current is 200mA. Output current is internally limited. Internal temperature protection disables voltage regulator at overtemperature.

DESCRIPTION

L4979 is a family of low dropout linear regulators with microprocessor control functions such as power on reset, low voltage reset, watchdog timer, on-off control or Enable. In addition, only low value ceramic capacitor is

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
Vvsdc	DC operating supply voltage	31	V
Vvstr	Transient operating supply voltage ($t < 400\text{ms}$)	-0.3 to 40	V
Ivsdc	Input current	internally limited	
Vvo	DC output voltage	-0.3 to 5.5	V
Ivo	DC output current	internally limited	
Vwi	Watchdog input voltage	-0.3 to 7	V
Vod	Open drain output voltage (RES)	-0.3 to 7	V
Iod	Open drain output current (RES)	internally limited	
Vcr	Reset delay voltage	-0.3 to 7	V
Vcw	Watchdog delay voltage	-0.3 to 7	V
Ven	Enable input voltage	-0.3 to 40	V
Tj	Junction temperature	-40 to 150	C
VESD	ESD voltage level (HBM-MIL STD 883C)	+/- 2	kV

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at any condition above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL DATA

Symbol	Parameter	Value	Unit
Rth j-amb	Thermal resistance Junction to Ambient (SO8)	130-180	°C/W
Rth j-amb	Thermal resistance Junction to Ambient (SO12+4+4)	50 (*)	°C/W

(*) with 6 sq. cm on board heat sink

ELECTRICAL CHARACTERISTICS

($V_s = 5.6\text{V}$ to 31V , $T_j = -40^\circ\text{C}$ to $+150^\circ\text{C}$ unless otherwise specified)

Pin	Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit

VOLTAGE REGULATOR

Voltage regulator uses a pchannel transistor as a regulating element. With this structure very low dropout voltage at current up to 150mA is obtained. The output voltage is regulated up to transient input supply voltage of 40V. No functional interruption due to over-voltage pulses is generated. The high precision of the output voltage is obtained with a pre-trimmed reference voltage. A short circuit protection to GND is provided.

RESET

The reset circuit supervises the output voltage V_o . The V_{o_th} reset threshold is defined with the internal reference voltage and a resistor output divider. If the output voltage becomes lower than V_{o_th} then Res goes low with a reaction time trr . If the output voltage becomes lower than 2.0V (typ) then Res goes immediately low. The reset low signal is guaranteed for an output voltage V_o greater than 1V.

When the output voltage becomes higher than V_{o_th} then Res goes high with a delay t_{rd} . This delay is obtained by an internal oscillator. Oscillator period is given by

$$T_{osc} = \frac{[(V_{rhth} - V_{rlth}) \cdot C_{tr}]}{I_{cr}} + \frac{[(V_{rhth} - V_{rlth}) \cdot C_{tr}]}{I_{cd}}$$

where:

I_{cr} is an internally generated charge current,

I_{cd} is an internally generated discharge current,

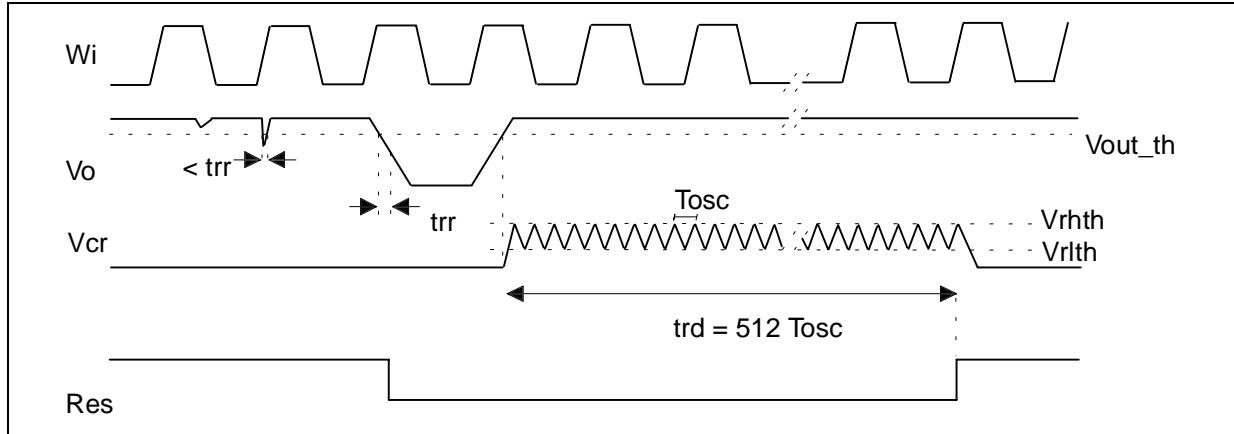

V_{rlth} and V_{rlth} are two voltages defined with the output voltage and a resistor output divider,

C_{tr} is an external capacitance,

t_{rd} is given by

$$t_{rd} = 512 \times T_{osc}$$

Figure 1. Reset Time Diagram.

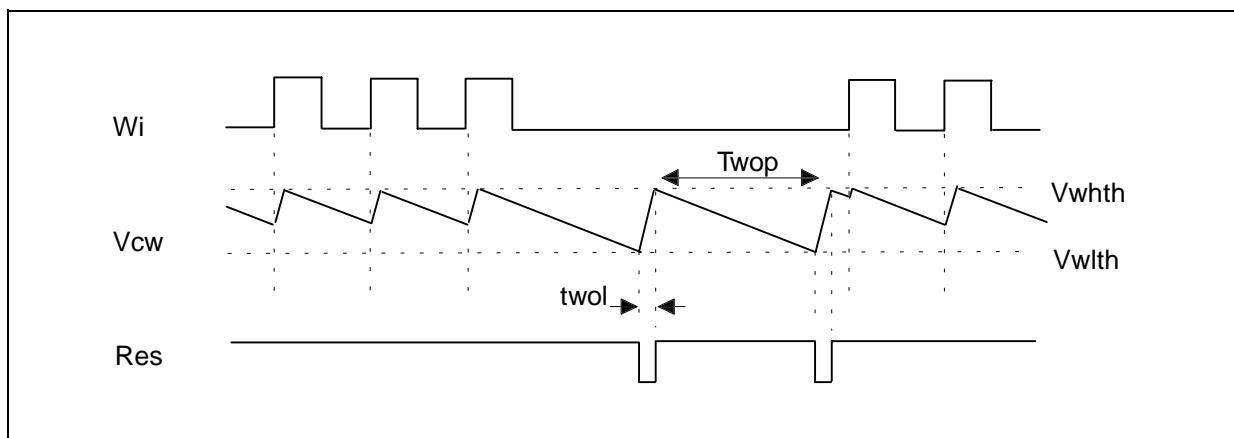

WATCHDOG

A connected microcontroller is monitored by the watchdog input W_i . If pulses are missing, the watchdog output W_o is set to low. The pulse sequence time can be set within a wide range with the external capacitor C_{tw} . The watchdog circuit discharges the capacitor C_{tw} with the constant current I_{cwd} . If the lower threshold V_{wlth} is reached, a watchdog reset is generated. To prevent this the microcontroller must generate a positive edge during the discharge of the capacitor before the voltage has reached the threshold V_{wlth} . In order to calculate the minimum time t during which the microcontroller must output the positive edge the following equation can be used:

$$(V_{whth} - V_{wlth}) \times C_{tw} = I_{cwd} \times t$$

Every W_i positive edge switches the current source from discharging to charging, the same happens when the lower threshold is reached. When the voltage reaches the upper threshold V_{whth} the current switches from charging to discharging. The result is a sawtooth voltage at the watchdog timer capacitor C_{tw} .
