LC74736PT — CMOS IC
On-Screen Display Controller

Overview

The LC74736PT is an on-screen display CMOS IC that displays characters and patterns on a TV screen under the control of a microcontroller.

For QVGA display, the LC74736PT supports the use of both a 16×16 dot character font and a 16×16 dot graphic font with 16 colors.

For WVGA display, the LC74736PT supports the use of both a 24×32 dot character font and a 24×32 dot graphic font with 16 colors.

The LC74736PT can also implement extremely varied displays by the use of an external ROM.

The LC74736PT supports both QVGA (480×234) and WVGA (800×480).

Features

(1) Screen structure

    Main: 2 screens (1 screen for WVGA display)

        30 characters×15 lines (up to 450 characters) on a QVGA panel

        33 characters×15 lines (up to 495 characters) on a WVGA panel

        (Up to 34 characters×18 lines)

    Wallpaper display screen:

        QVGA mode: maximum   Permanent repetition of a 4×4 (horizontal×vertical) character pattern

        WVGA mode: maximum   Permanent repetition of a 2×2 (horizontal×vertical) character pattern

(2) Character structure

    QVGA mode: About 9MHz

        16 dots (horizontal) ×16 dots (vertical): Character display

        16 dots (horizontal) ×16 dots (vertical): Graphic glyph display

    WVGA mode: About 33.2MHz

        24 dots (horizontal) ×32 dots (vertical): Character display

        24 dots (horizontal) ×32 dots (vertical): Graphic glyph display

    Character display clock:

        LC oscillator (about 10MHz)

        External clock signal input (up to 40MHz)

        Built-in PLL (VCO) (7 to 40MHz)

(3) Number of characters

    QVGA mode

        Up to 16384 characters when an external 16-bit 16M ROM is used.

    WVGA mode

        Up to 4096 characters when an external 16-bit 16M ROM is used.

          No internal ROM

          Internal character RAM   QVGA: 4 characters, WVGA: 1 character

(4) Character sizes: Four horizontal sizes (1×, 2×, 3×, and 4×)

                      Four vertical sizes (1×, 2×, 3×, and 4×)

                      (The character size is specified in line units.)

(5) Display start positions: 1024 positions in the horizontal direction and 512 positions in the vertical direction.

    Setting units: Horizontal: 1 dot (in screen units)

                 Vertical: 1 dot (in screen units)

(6) Display functions

    • Blinking specification (in character units)

        Period: 1/64, 1/32, and 1/16 of the vertical sync signal (in screen units)

        Duty: Fixed at 50%

    • Box (raised or recessed) display

        Raised/recessed specification   (in character units)

        Left: Off/on specification   (in character units)

        Right: Off/on specification   (in character units)

        Top: Off/on specification   (in character units)

        Bottom: Off/on specification   (in character units)

    • Border specification (in line units): Only valid with glyphs from the character font.

(7) Color specification

    Character

        • Character color (in character units):   1 of 16 colors can be specified.

        • Character background color (in character units): 1 of 16 colors can be specified.

        • Border color (in line units):   1 of 16 colors can be specified.

    Graphic

        • 16 types can be specified by ROM data

    Graphic 2

        • 16 types can be specified by ROM data

          1 color type can be changed.

    Graphic 3

        • 16 types can be specified by ROM data

          1 color table type can be changed.

        • Box (raised or recessed) color (line units): 1 of 16 colors can be specified.

        • Background color (screen units): 1 of 16 colors can be specified.

(8) Color table (palette)
- Sixteen colors can be selected from a set of 4096 colors (One of which is specified to be transparent.)
- Number of color tables: 4. This allows up to 64 colors to be displayed at the same time.

(9) Wallpaper screen (Graphics glyphs only)

Wallpaper display: Repeated display under the main screen
(up to 4 characters horizontally by 4 characters vertically).

Sprite character display: Displayed above the main screen
(up to 4 characters horizontally by 4 characters vertically).

(10) Line spacing control

0-15 scan lines (in line units)

(11) Output

Analog RGB output(to 20MHz)

Digital RGB output (4 bits per color)

BLK (OSD display period signal)

Package: TQFP100
Voltage: 3.3V

Package Dimensions

unit : mm (typ)

3274

SANYO : TQFP100(14X14)

Pin Functions

Pin No.	Symbol	Type	Functional description
1	$V_{SS}1$	Ground	Connect a ground to this pin. (Digital system ground)
2	$V_{DD}1$	Power supply (+3.3V)	Digital system power supply: +3.3V
3	OSCin	LC oscillator	Connect to the character output dot clock generator oscillator coil and
4	OSCout		capacitor.
5	EXTclk	External clock signal input	Receives an external clock signal. Capacitor coupling, 50% duty cycle, 0.5Vp-p or higher
6	CTRL1	OSCin oscillator input control	Switches between external clock input mode and LC oscillator mode. Low: LC oscillator, high: external clock input MORE+ OR control with MORE+ command
7	SCLK	Clock input	Clock input for the serial data input system MORE+ (This input has hysteresis characteristics.)
8	SIN	Data input	Serial data input MORE+ (This input has hysteresis characteristics.)
9	$\overline{CS}$	Enable input	Enable input for the serial data input system. Serial data input is enabled when this pin is set low. MORE+ (This input has hysteresis characteristics.)
10	VSYNC	Vertical sync signal input	Vertical sync signal input MORE+ (This input has hysteresis characteristics.)
11	HSYNC	Horizontal sync signal input	Horizontal sync signal input MORE+ (This input has hysteresis characteristics.)
12	TEST1	Test mode control 1	Test mode control 1 Low: normal operation, high: test mode MORE+
13	TEST2	Test mode control 2	Test mode control 2 Low: normal operation, high: test mode (scan mode) MORE+
14	$\overline{RST}$	Reset input	System reset input MORE+ (This input has hysteresis characteristics.)
15	CLKOUT	Clock output	Clock output
16	$V_{SS}1$	Ground	Connect a ground to this pin. (Digital system ground)
17	NC		
18	NC		
19	NC		
20	NC		
21	NC		
22	$V_{SS}4$	Ground	Connect a ground tro this pin. (PLL system power supply)
23	PD0	PLL charge pump output / PLL VCO control voltage input	Charge pump output Connect a LPF (lug lead filter) to this pin. Voltage input for internal VCO control
24	VCOR	VCO variable range adjustment	Used to adjust variable voltage range of internal VCO. Connect a resistor to this pin.
25	$V_{DD}4$	Power supply (+3.3V)	PLL system power supply: +3.3V
26	BFin	Amplifier input	Oscillation input for external VCO
27	BFout	Amplifier output	Oscillation output for external VCO
28	RD3	Rout output: bit 3	Rout output This is a 4-bit digital output with values from 0000 to 1111.
29	RD2	Rout output: bit 2	
30	RD1	Rout output: bit 1	
31	RD0	Rout output: bit 0	
32	GD3	Gout output: bit 3	Gout output This is a 4-bit digital output with values from 0000 to 1111.
33	GD2	Gout output: bit 2	
34	GD1	Gout output: bit 1	
35	GD0	Gout output: bit 0	
36	$V_{DD}1$	Power supply (+3.3V)	Digital system power supply: +3.3V

LC74736PT

Pin No.	Symbol	Type	Functional description
37	BD3	Bout output: bit 3	Bout output
38	BD2	Bout output: bit 2	This is a 4-bit digital output with values from 0000 to 1111.
39	BD1	Bout output: bit 1	
40	BD0	Bout output: bit 0	
41	BLK	Blanking signal output	This signal indicates the OSD display period.
42	HFTOT	Halftone control signal output	OSD halftone period control signal Synthesized in the next stage IC.
43	$V_{SS}1$	Ground	Connect a ground to this pin. (Digital system ground)
44	Rout	Rout output: analog	D/A converter (4 bits) output. Connect a resistor Ro to this pin.
45	Gout	Gout output: analog	D/A converter (4 bits) output. Connect a resistor Ro to this pin.
46	Bout	Bout output: analog	D/A converter (4 bits) output. Connect a resistor Ro to this pin.
47	RREF	Reference resistor connection	Connect a reference register to this pin.
48	$V_{DD}2$	Power supply (+3.3V)	D/A converter power supply: +3.3V
49	CCOMP	Phase correction capacitor connection	Capacitor connection: 1.5μF
50	$V_{SS}2$	Ground	Connect a ground to this pin. (D/A converter ground)
51	D15	Data input 15	ROM data input 15. MORE+ [MSB]
52	D14	Data input 14	ROM data input 14. MORE+
53	D13	Data input 13	ROM data input 13. MORE+
54	D12	Data input 12	ROM data input 12. MORE+
55	D11	Data input 11	ROM data input 11. MORE+ [MSB]
56	D10	Data input 10	ROM data input 10. MORE+
57	D9	Data input 9	ROM data input 9. MORE+
58	D8	Data input 8	ROM data input 8. MORE+
59	$V_{SS}1$	Ground	Connect a ground to this pin. (Digital system ground)
60	$V_{DD}1$	Power supply (+3.3V)	Digital system power supply: +3.3V
61	D7	Data input 7	ROM data input 7. MORE+
62	D6	Data input 6	ROM data input 6. MORE+
63	D5	Data input 5	ROM data input 5. MORE+
64	D4	Data input 4	ROM data input 4. MORE+
65	D3	Data input 3	ROM data input 3. MORE+
66	D2	Data input 2	ROM data input 2. MORE+
67	D1	Data input 1	ROM data input 1. MORE+
68	D0	Data input 0	ROM data input 0. MORE+ [LSB][LSB]
69	$V_{SS}1$	Ground	Connect a ground to this pin. (Digital system ground)
70	$V_{DD}1$	Power supply (+3.3V)	Power supply: (+3.3V: Digital system)
71	$V_{SS}3$	Ground	Connect a ground to this pin. (External ROM output system ground)
72	$V_{DD}3$	Power supply (+3.3 or +5.5V)	Power supply (External ROM output system power supply)
73	$\overline{OE}$	Output enable	ROM output enable output. This is an active low output.
74	$\overline{CE}$	Chip enable	ROM chip enable output. This is an active low output.
75	A19	Address output 19	ROM address output 19
76	A18	Address output 18	ROM address output 18
77	A17	Address output 17	ROM address output 17
78	A16	Address output 16	ROM address output 16
79	$V_{SS}3$	Ground	Connect a ground to this pin. (External ROM output system ground)
80	$V_{DD}3$	Power supply (+3.3 or +5.5V)	Power supply (External ROM output system power supply)
81	A15	Address output 15	ROM address output 15
82	A14	Address output 14	ROM address output 14
83	A13	Address output 13	ROM address output 13
84	A12	Address output 12	ROM address output 12
85	A11	Address output 11	ROM address output 11

System Block Diagram

Display Control Commands

The display control commands have serial input format that consists of 8-bit units transmitted LSB first. A commands consists of a command identification code in the first byte and data in the second and following bytes. Both a first byte and a second byte (16 bits) must be transmitted for each command. Commands 10, 11, 12, 6C1, and 701 set the IC to continuous write mode. (Continuous write mode is cleared by setting the CS pin high.)

Display Control Command Table

Command	First byte								Second byte							
	Command identification code data								Data

0	TR0	0		
		1		

*: This resistor is set to the all bits zero state when the IC is reset by the $\overline{RST}$ pin.

When transparent is selected, the BLK output is set to the low level. (Transparent state)

The RGB outputs are values from the color table.

The transparent specification is best for color table 1, address 0000.

Since the data is set to all zeros by a RAM clear operation,

the RGB output will be 000 (black) and the BLK output will be 1.

Transparent is specified by setting the TOK bit to 1. (The BLK output will go to the low level.)

Display Structure

The display screen consists of a 34-character×18-line grid (maximum).
- QVGA mode (16×16 dot characters)
    QVGA panel (480×234) 30-character×15-line
- WVGA mode (24×32 dot characters)
    WVGA panel (800×480) 33-character×15-line

Up to a maximum of 612 characters can be displayed.

If the character size is increased, the number of characters that can be displayed will decrease to be fewer than 612 characters.

　　Display memory is addressed by specifying a line address (00 to 17 (hexadecimal)) and a character position address (00 to 32 (hexadecimal)).

　　Display memory is addressed by specifying a line address (00 to 11 (hexadecimal)) and a character position address (00 to 21 (hexadecimal)).

Display structure (Display memory address): 34 characters×18 lines (maximum)

```
00                                                                    33
00                                                                    21
```

Operational Description

  1. Command transfer method

    1.1 Overview

     (1) Commands are transferred in 8-bit units, LSB first.

       Always send a first byte and a second byte (16 bits).

     (2) COMMAND10 (Main screen 1 RAM write)

       COMMAND11 (Main screen 2 RAM write)

       COMMAND12 (Subscreen write)

       COMMNAD6C1 (Color table write)

       COMMAND701 (Character RAM write) is locked in continuous write mode when a continuous mode is specified (RM2, 1 RM3). (Continuous mode is cleared by setting the CS pin high.)

    1.2 Writing Data to VRAM

     (1) Write start address specification

       Write start address is set using:

       COMMAND00, COMMAND01 (Main screen 1)

       COMMAND02, COMMAND03 (Main screen 2)

       COMMAND04   (Subscreen)

        V4 to V0: Vertical direction; H5 to H0: Horizontal direction

     (2) Data write

       Continuous write mode differs depending on the write mode specification. (RM1, RM2)

       1. Normal (RM2 = 0, RM1 = 0: initial state) *Continuous mode not used*

       -- COM10-1 10-2-1 10-2-2 10-2-3 10-2-4 10-2-5 command wait state --

       2. Write continuous (RM2 = 0, RM1 = 1): Mode 2

       COM10-1 10-2-1 10-2-2 10-2-3 10-2-4 10-2-5
       3. Write continuous (RM2 = 1, RM1 = 0): Mode 3

       COM10-1 10-2-1 10-2-2 10-2-3 10-2-4 10-2-5 10-2-3 10-2-4 10-2-5
       4. Write continuous (RM2 = 1, RM1 = 1): Mode 4

       COM10-1 10-2-1 10-2-2 10-2-3 10-2-4 10-2-5 10-2-2 10-2-3 10-2-4 10-2-5
    *: In modes 2, 3, and 4, the IC remains locked in continuous write mode until the $\overline{CS}$ pin is set high.

    • The write address is automatically incremented.

    • The write address is retained unless the IC is reset or a new write address is issued.

1.3 Color Table write
 (1) Write start address specification
    Use command 6C0 to set the color table write start address.
    CTN1 to CTN0: Color table specification (No.1 to No.4), CTA3 to CTA0: Address specification

No.1

	B	G	R
0 0 0 0	XX XXXX	XXXX	XXXX
0 0 0 1			
0 0 1 0			
Address			
1 1 1 0			
1 1 1 1			

 (2) Data write
    Continuous write mode differs depending on the write mode specification. (RM3)
     1. Normal (RM3 = 0: initial state) *Continuous mode not used*
     ---COM6C1-1 6C1-2-1 6C1-2-2 command wait state ---

     2. Write continuous (RM3 = 1) mode
     COM6C1-1 6C1-2-1 6C1-2-2 ─┐

    *: In mode 2, the IC remains locked in continuous write mode until the $\overline{CS}$ pin is set high.
    • The write address is automatically incremented.
    • The write address is retained unless the IC is reset or a new write address is issued.

1.4 Character RAM write

(1) Write start address specification

Use COMMAND700 to specify the character RAM write start address.

FAD1 to FAD0: Character RAM address P-No specification

QVGA: 0 to 3, hexadecimal, (4 characters)

WVGA: 1 character only 0 to 3 (hexadecimal)   P1 to P4

FVA3 to FVA0: Character RAM V dot address specificatrion 0 to F (hexadecimal)

FRN1 to FRN0: ROM No. specification 0 to 3 (hexadecimal)   No.1 to No.4
```
           D15 to                              D0
        ┌─────────────────────────────────────┐
0 0 0 0 │                                     │
0 0 0 1 │                                     │
0 0 1 0 │                                     │
V dot   │                                     │
Address │                                     │
        │                                     │
        │                                     │
        │                                     │
1 1 1 0 │                                     │
1 1 1 1 │                                     │
        └─────────────────────────────────────┘
```

(2) Data write

Continuous write mode differs depending on the write mode specification. (RM3)

1. Normal (RM3 = 0: initial state) *Continuous mode not used*

---COM701-1 701-2-1 701-2-2 command wait state ---
2. Write continuous (RM3 = 1) mode

COM701-1 701-2-1 701-2-2 ┐
      ▲_____┘

*: In mode 2, the IC remains locked in continuous write mode until the $\overline{CS}$ pin is set high.

• The write address is automatically incremented.

• The write address is retained unless the IC is reset or a new write address is issued.

2. Display format
   2.1 Color Specification Related Items
     (1) When a character is specified
       Specify color with the character color (character area) and character background color
       (outside the character area)
         Character color: 1 of 16 colors
         Character background color: 1 of 16 colors
       Color tables: Table No. 1 to No. 4 specified by CT1 to CT0. (COM10-2-3: VRAM)
             1 of 64 types

Character color
Specified by CC0 to CC3: 1of 16 colors
(COM10-2-2: VRAM)

Character background color
Specified by CB0 to CB3: 1 of 16 colors
(COM10-2-2: VRAM)
     (2) When a graphic 1 is specified
       Specify color is in dot units (16×16)
       1 of 16 colors (FROM)
       Color tables: Table No. 1 to No. 4 specified by CT1 to CT0. (COM10-2-3: VRAM)
             1 of 64 types

Specified by FROM: 1 of 16 types
(3) When a graphic 2 is specified
Specify color is in dot units (16×16)
1 of 16 colors (FROM)
Color tables: Table No. 1 to No. 4 specified by CT1 to CT0. (COM10-2-3: VRAM)
1 of 64 types

The CTB address display color shown with CB3 to CB0 is changed to the CTB address display color shown with CC3 to CC0.
One color in the graphic character display can be changed by setting CB and CC.

Specified by FROM: 1 of 16 types
(4) When a graphic 3 is specified
Specify color is in dot units (16×16)
1 of 16 colors (FROM)
Color tables: Table No. 1 to No. 4 specified by CT1 to CT0. (COM10-2-3: VRAM)
1 of 64 types

CTB No. in the address shown with CB3 to CB0 is changed to CTB No. shown with CC1 to CC0 and display it.
CTB No. of one color in the graphic character display can be changed by setting CB and CC.

Specified by FROM: 1 of 16 types
2.2 Display Control Related Items

(1) Blinking: In character units

    1. Normal at1 = 0 (COM10-2-1: VRAM)
    2. Blinking at1 = 1

    Display alternates between normal and transparent with the blinking period. (COM21-2: BK1, BK0)

(2) Border display: Only valid for font specified characters

    1. Border color: 1 of 16 colors (COM60-2 EGC3 to EGC0)

    Color table specification (COM60-2 EGCT1 to EGCT0)

    → 1 of 64 types specified in line units

    2. Border mode control (COM60-2 BLK1, BLK0) specified in line units

i. Border
ii. Shadow 1: lower
iii. Shadow 2: lower + right
(3) Character size: Specified in line units
The character size is specified as 1x to 4x independently for the vertical and horizontal directions.
(COM40-2)

2.3 Box Display (raised/recessed)

raised   recessed
16 dots
(1) Raised/recessed specification: In character units (COM10-2-1 BXS)
(2) Left side-displayed/undisplayed specification: in character units (COM10-2-1 BXL)
(3) Right side-displayed/undisplayed specification: in character units (COM10-2-1 BXR)
(4) Upper side-displayed/undisplayed specification: in character units (COM10-2-1 BXU)
(5) Lower side-displayed/undisplayed specification: in character units (COM10-2-1 BXD)
(6) Color specification: In line units
    COM50 (Upper side)
    COM51 (Lower side)
      BXUC3 to BXDC0: 1 of 16 colors
      BXDC3 to BXDC0: 1 of 16 colors
    Color table specification
      BXUCT1 to BXUCT0
      BXDCT1 to BXUCT0
      1 of 64 types
    Box dot width specification
      Each of left, right, upper, and lower can be specified independently.
      Left: BXLW1 to BXLW0   1 to 4 dots
      Right: BXRW1 to BXRW0   1 to 4 dots
    Upper and lower (COM59-2)
      Upper BXWU   1 to 2 dots (It depends on the character size.)
      Lower BXWD   1 to 2 dots (It depends on the character size.)

2.4 Line spacing control (Command 58-2: GY3, GY2, GY1, GY0)
- Line spacing display control
  COM58-2: GS1, GS0

	Character	Graphic
(1)	Transparent	Transparent
(2)	Transparent	Transparent
	±1(character background color)	±1(CB specified color)
(3)	Character background color	CB setting color
(4)	Transparent	Transparent
	(Border enabled)	

- Basic line spacing unit
  GYBCK "0": 1V
         "1": It depends on the character size.

- Box display (COM59-2)
  Character display range

16

16
Box display
Inside the character
Outside the character 1
(Valid only when line spacing is set.)
Outside the character 2
(Valid only when line spacing is set.)

BXC1 = "0"
BXC2 = "0"

BXC1 = "1"
BXC2 = "1"
BXC3 = "0"

BXC1 = "1"
BXC2 = "1"
BXC3 = "1"

2.5 Screen Structure

Screen background color

Wallpaper display screen

Main screen 2
16×16 dot characters
30-character×15-line QVGA panel

Main screen 1
16×16 dot characters
30-character×15-line
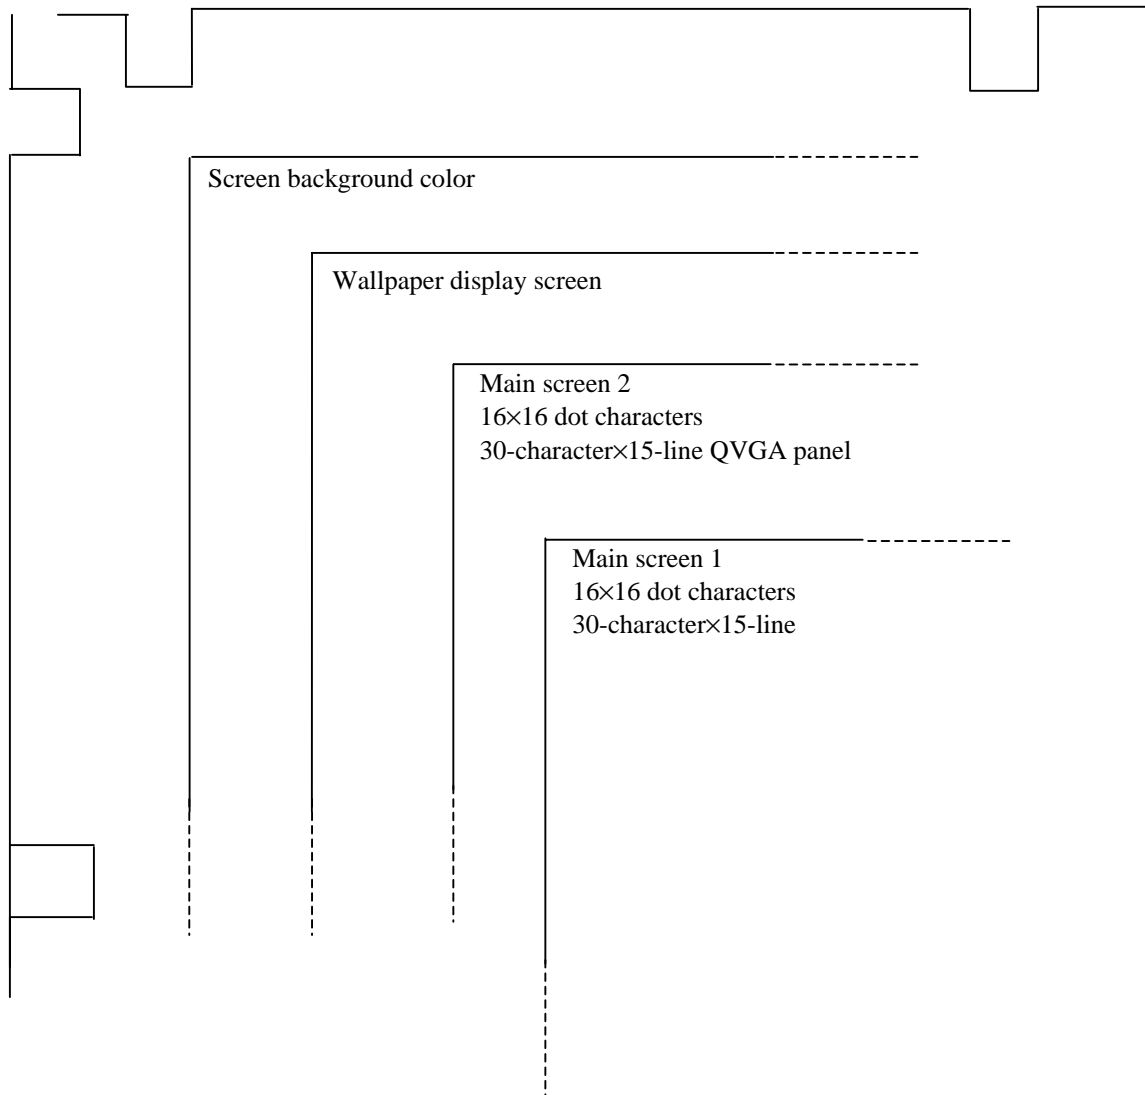

- For each screen: Display on/off (transparent) can be specified independently.
- For each screen: The display start position can be specified independently.
  The wallpaper display screen and the main screen require xxxx clocks before the horizontal start position is reached.

• Display Format
  1) QVGA

Character specification 16 dots	Graphic 16 dots

16H

  2) WVGA

Character specification 24 dots	Graphic 24 dots

32H
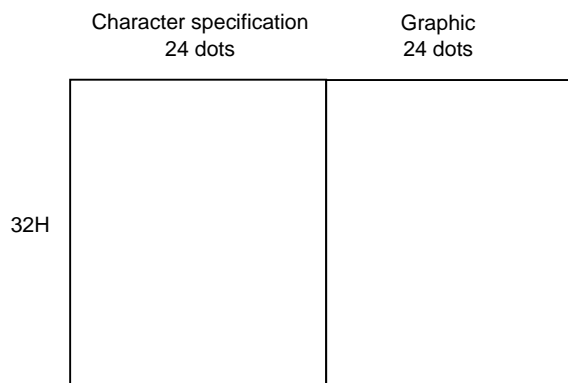

• ROM structure
  (1) No internal ROM
  (2) Internal character RAM QVGA: 4 characters, WVGA: 1 character
    1) Character font
       QVGA: 16×16-dot structure
       WVGA: 24×32-dot structure
    2) Graphics
       QVGA: 16×16-dot structure
       WVGA: 24×32-dot structure

(3) External ROM (QVGA: 16384 characters, WVGA: 4096 characters)
　×16 types, 16M
　1) Conditions
　　• QVGA mode
　　Access time = 2× dot clock frequency or shorter
　　　Example: DCLK = 10MHz = 100ns×2 = 200ns or shorter
　　• WVGA mode
　　1) Access time =3× dot clock frequency or shorter, with display limitations
　　　Example: DCLK = 33MHz = 30ns×3 = 90ns or shorter
　　2) Access time =2× dot clock frequency or shorter, with display limitations
　　　Example: DCLK = 33MHz = 30ns×2 = 60ns or shorter
　　3) Access time =1× dot clock frequency or shorter
　　　Example: DCLK = 33MHz = 30ns×1 = 30ns or shorter
