

6GHz, 1:6 CML FANOUT BUFFER WITH 2:1 MUX INPUT AND INTERNAL I/O TERMINATION

Precision Edge®
SY58034U

FEATURES

- Provides six ultra-low skew copies of the selected input
- 2:1 MUX input included for clock switchover applications
- Guaranteed AC performance over temperature and voltage:
 - Clock frequency range: DC to > 6GHz
 - <290ps IN-to-OUT t_{pd}
 - <60ps t_r / t_f times
 - <20ps skew (output-to-output)
- Unique input isolation design minimizes crosstalk
- Ultra low-jitter design:
 - <1ps_{RMS} random jitter
 - <10ps_{PP} total jitter (clock)
 - <1ps_{RMS} cycle-to-cycle jitter
 - <0.7ps_{RMS} crosstalk-induced jitter
- Low supply voltage operation: 2.5V and 3.3V
- Unique input termination and VT pin accepts DC-coupled and AC-coupled inputs (CML, PECL, LVDS)
- Internal 50Ω output source termination
- 400mV CML output swing
- -40°C to +85°C temperature range
- Available in 32-pin (5mm × 5mm) MLF® package

Precision Edge®

DESCRIPTION

The SY58034U is a 2.5V/3.3V precision, high-speed 1:6 fanout buffer capable of handling clocks up to 6GHz. A differential 2:1 MUX input is included for redundant clock switchover applications.

The differential input includes Micrel's unique, 3-pin input termination architecture that allows the device to interface to any differential signal (AC- or DC-coupled) as small as 100mV without any level shifting or termination resistor networks in the signal path. The outputs are 50Ω source terminated CML, with extremely fast rise/fall times guaranteed to be less than 60ps.

The SY58034U operates from a 2.5V ±5% supply or a 3.3V ±10% supply and is guaranteed over the full industrial temperature range of -40°C to +85°C. For applications that require LVPECL outputs, consider the SY58035U or SY58036U Multiplexers. The SY58034U is part of Micrel's high-speed, Precision Edge® product line.

All support documentation can be found on Micrel's web site at www.micrel.com.

APPLICATIONS

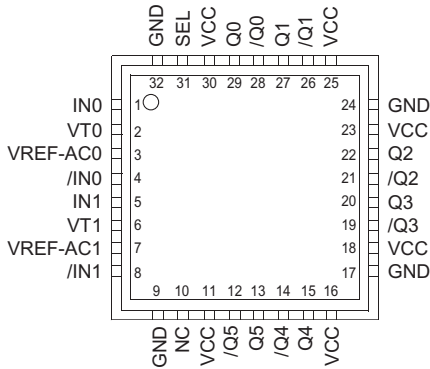

- Redundant clock distribution
- All SONET/SDH clock distribution
- All Fibre Channel distribution
- All Gigabit Ethernet clock distribution

PIN DESCRIPTION

Pin Number	Pin Name	Pin Function
1, 4 5, 8	IN0, /IN0 IN1, /IN1	Differential Input: These input pairs are the differential signal inputs to the device. These inputs accept AC- or DC-coupled signals as small as 100mV. Each pin of a pair internally terminates to a VT pin through 50Ω. Note that these inputs will default to an indeterminate state if left open. Please refer to the “Input Interface Applications” section for more details.
2, 6	VT0, VT1	Input Termination Center-Tap: Each side of the differential input pair terminates to a VT pin. The VT0 and VT1 pins provide a center-tap to a termination network for maximum interface flexibility. See “Input Interface Applications” section for more details.
31	SEL	This single-ended TTL/CMOS-compatible input selects the inputs to the multiplexer. Note that this input is internally connected to a 25kΩ pull-up resistor and will default to a logic HIGH state if left open. The MUX select switchover function is asynchronous.
10	NC	No connect.
11, 16, 18, 23, 25, 30	VCC	Positive Power Supply: Bypass with 0.1μF 0.01μF low ESR capacitors and place as close to the VCC pins as possible.
29, 28 27, 26 22, 21 20, 19 15, 14 13, 12	Q0, /Q0, Q1, /Q1, Q2, /Q2, Q3, /Q3, Q4, /Q4, Q5, /Q5	Differential Outputs: These CML output pairs are low skew output copies of the selected input. The output stage is optimized to deliver a 400mV swing (single-ended) into 50Ω. Each output includes a 50Ω source-termination resistor, thus minimizing any return reflections. Unused output pins may be left floating. Please refer to the “Truth Table” for details.
9, 17, 24, 32	GND, Exposed Pad	Ground. Ground pin and exposed pad must be connected to the same ground plane.
3, 7	VREF-AC0, VREF-AC1	Reference Voltage: These output biases to V _{CC} -1.2V. It is used for AC-coupling inputs (IN, /IN). Connect V _{REF-AC} directly to the VT pin. Bypass with 0.01μF low ESR capacitor to V _{CC} . See “Input Interface Applications” section. Maximum sink/source current is ±1.5mA. Due to the limited capability, the VREF-AC pin is only intended to drive its respective VT pin.

Notes:

1. Permanent device damage may occur if the measurements in the "Absolute Maximum Ratings" section are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Thermal performance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB. ψ_{JB} and θ_{JA} are determined for a 4-layer board in a still air, unless otherwise stated.
4. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.

Notes:

- High frequency AC electricals are guaranteed by design and characterization.
- Output-to-output skew is measured between outputs under identical transitions.
- Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
- Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles, $T_n - T_{n-1}$ where T is the time between rising edges of the output signal.
- Random jitter is measured with a K28.7 pattern, measured at 2.5Gbps.
- Total jitter definition: with an ideal clock input of frequency $\leq f_{MAX}$, no more than one output edge in 10^{12} output edges will deviate by more than the specified peak-to-peak jitter value.
- Crosstalk is measured at the output while applying two similar clock frequencies that are asynchronous with respect to each other at the inputs.
