

120mA LDO REGULATOR

NO.EA-074-0606

OUTLINE

The R1140Q Series are CMOS-based voltage regulator ICs with high output voltage accuracy, low supply current, low ON-resistance, and high ripple rejection. Each of these voltage regulator ICs consists of a voltage reference unit, an error amplifier, resistors for setting Output Voltage, a current limit circuit, and a chip enable circuit.

These ICs perform with low dropout voltage and a chip enable function. The line transient response and load transient response of the R1140Q Series are excellent, thus these ICs are very suitable for the power supply for hand-held communication equipment.

The output voltage of these ICs is internally fixed with high accuracy. Since the package for these ICs is SC-82AB (Super Mini-mold) package, high density mounting of the ICs on boards is possible.

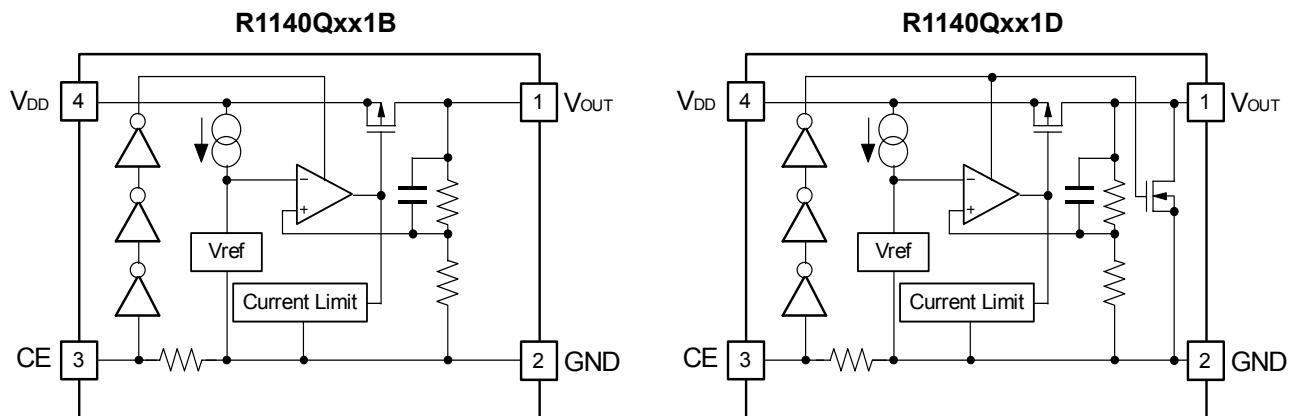

FEATURES

- Ultra-Low Supply Current..... Typ. 75 μ A
- Standby Mode Typ. 0.1 μ A
- Low Dropout Voltage..... Typ. 0.15V (I_{OUT} =100mA, Output Voltage=3.0V Type)
- High Ripple Rejection Typ. 75dB (f=1kHz)
- Low Temperature-Drift Coefficient of Output Voltage... Typ. \pm 100ppm/ $^{\circ}$ C
- Excellent Line Regulation Typ. 0.05%/V
- High Output Voltage Accuracy \pm 2.0%
- Output Voltage Range..... 1.5V to 4.0V
- Excellent Dynamic Response
- Small Package SC-82AB (Super Mini-mold)
- Built-in Chip Enable Circuit (B/D : active high)
- Built-in Fold-back Protection Circuit..... Typ. 40mA (Current at short mode)

APPLICATION

- Power source for cellular phones such as GSM, CDMA and various kinds of PCS.
- Power source for electrical appliances such as cameras, VCRs and camcorders.
- Power source for battery-powered equipment.

SELECTION GUIDE

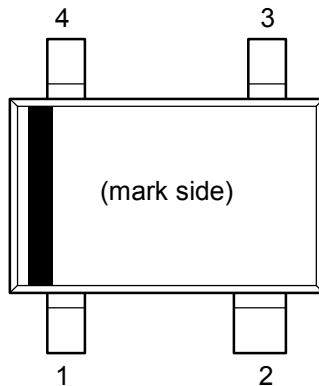

The output voltage, mask option, and the taping type for the ICs can be selected at the user's request.
The selection can be made by designating the part number as shown below;:

R1140Q_a_b_c_d_eX-XX-X ← Part Number
 ↑↑↑↑↑
 a b c d e

Code	Contents
a	Designation of Package Type Q: SC-82AB (Super Mini-mold)
b	Setting Output Voltage (V_{OUT}): Stepwise setting with a step of 0.1V in the range of 1.5V to 4.0V is possible.
c	Designation of Mask Option : B: Without auto discharge function at OFF state. D: With auto discharge function at OFF state.
d	Designation of Taping Type : Ex. TR, TL (refer to Taping Specifications; TR type is the standard direction.)
e	Designation of composition of pin plating -F : Lead free plating

TECHNICAL NOTES

When using these ICs, consider the following points:

Phase Compensation

In these ICs, phase compensation is made for securing stable operation even if the load current is varied. For this purpose, be sure to use a $2.2\mu F$ or more capacitor C_{OUT} with good frequency characteristics and ESR (Equivalent Series Resistance).

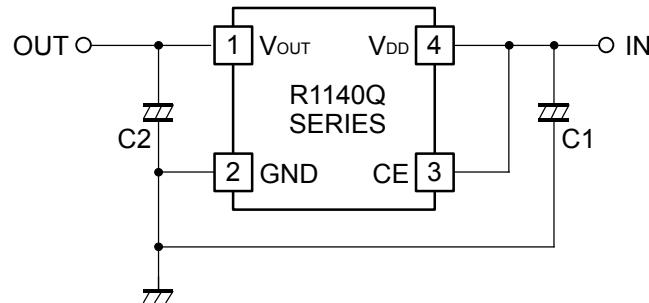

(Note: When the additional ceramic capacitors are connected to the Output Pin with Output capacitor for phase compensation, the operation might be unstable. Because of this, test these ICs with as same external components as ones to be used on the PCB.)

PCB Layout

Make V_{DD} and GND line sufficient. When the impedance of these is high, it would be a cause of picking up the noise or unstable operation. Connect a capacitor with as much as $1.0\mu F$ capacitor between V_{DD} and GND pin as close as possible.

Set external components, especially output capacitor as close as possible to the ICs and make wiring shortest.

ESR vs. Output Current

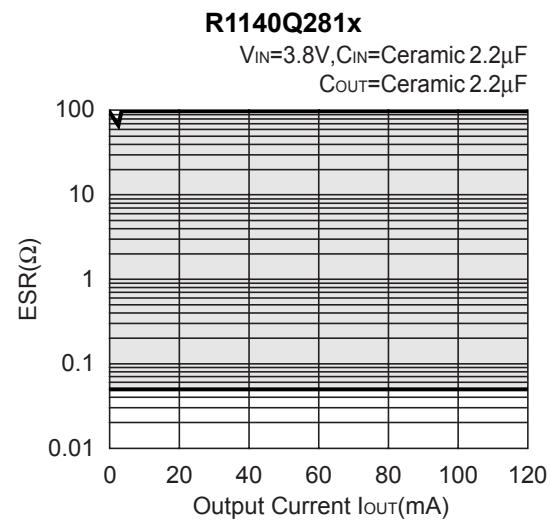

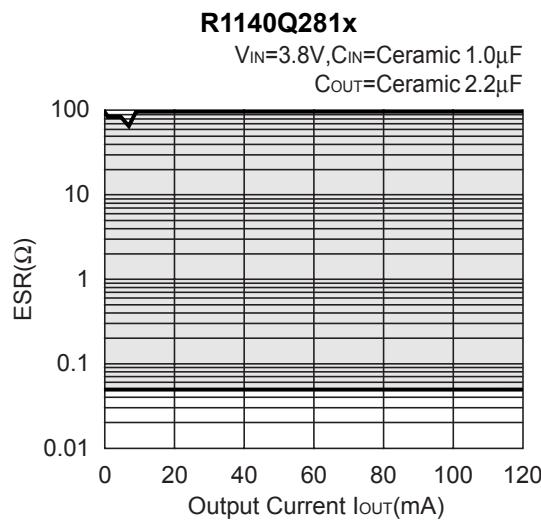

When using these ICs, consider the following points:

In these ICs, phase compensation is made for securing stable operation even if the load current is varied. For this purpose, be sure to use a capacitor C_{out} with good frequency characteristics and ESR (Equivalent Series Resistance) of which is in the range described as follows:

The relations between I_{out} (Output Current) and ESR of Output Capacitor are shown below. The conditions when the white noise level is under $40\mu V$ (Avg.) are marked as the hatched area in the graph.
