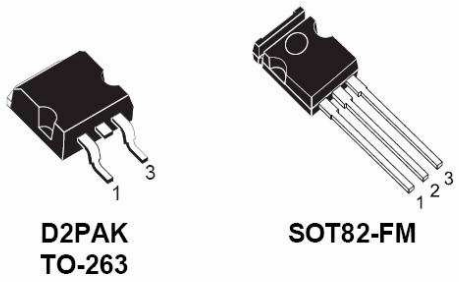
VNB14N04 - VNK14N04FM VNV14N04

"OMNIFET"
fully autoprotected Power MOSFET

Features

Type	V_{clamp}	$R_{DS(on)}$	I_{lim}
VNB14N04	42 V	0.07 Ω	14 A
VNK14N04FM	42 V	0.07 Ω	14 A
VNV14N04	42 V	0.07 Ω	14 A

- Linear current limitation
- Thermal shutdown
- Short circuit protection
- Integrated clamp
- Low current drawn from input pin
- Diagnostic feedback through input pin
- ESD protection
- Direct access to the gate of the power MOSFET (analog driving)
- Compatible with standard power MOSFET



Description

The VNB14N04, VNK14N04FM and VNV14N04 are monolithic devices made using STMicroeletronics VIPower M0 Technology, intended for replacement of standard power MOSFETS in DC to 50 kHz applications. Built-in thermal shutdown, linear current limitation and overvoltage clamp protect the chip in harsh environment.

Fault feedback can be detected by monitoring the voltage at the input pin.

Table 1. Device summary

Part number	Order code
VNB14N04	VNB14N04, VNB14N04-E, VNB14N0413TR, VNB14N04TR-E
VNK14N04FM	VNK14N04FM
VNV14N04	VNV14N04, VNV14N04-E

1. Pulsed: Pulse duration = 300 µs, duty cycle 1.5 %
2. Parameters guaranteed by design/characterization

3 Protection features

During normal operation, the Input pin is electrically connected to the gate of the internal power MOSFET. The device then behaves like a standard power MOSFET and can be used as a switch from DC to 50 kHz. The only difference from the user's standpoint is that a small DC current (I_{iss}) flows into the Input pin in order to supply the internal circuitry.

The device integrates:

- Overvoltage clamp protection: internally set at 42 V, along with the rugged avalanche characteristics of the Power MOSFET stage give this device unrivalled ruggedness and energy handling capability. This feature is mainly important when driving inductive loads.
- Linear current limiter circuit: limits the drain current Id to Ilim whatever the Input pin voltage. When the current limiter is active, the device operates in the linear region, so power dissipation may exceed the capability of the heatsink. Both case and junction temperatures increase, and if this phase lasts long enough, junction temperature may reach the overtemperature threshold T_{jsh}.
- Overtemperature and short circuit protection: these are based on sensing the chip temperature and are not dependent on the input voltage. The location of the sensing element on the chip in the power stage area ensures fast, accurate detection of the junction temperature. Overtemperature cutout occurs at minimum 150 °C. The device is automatically restarted when the chip temperature falls below 135 °C.
- Status feedback: in the case of an overtemperature fault condition, a Status Feedback is provided through the Input pin. The internal protection circuit disconnects the input from the gate and connects it instead to ground via an equivalent resistance of 100 Ω. The failure can be detected by monitoring the voltage at the Input pin, which will be close to ground potential.

Additional features of this device are ESD protection according to the Human Body model and the ability to be driven from a TTL Logic circuit (with a small increase in $R_{DS(on)}$).
