

STV2112B

BUS-CONTROLLED PAL/SECAM TV PROCESSOR

- I²C BUS CONTROL OF ALL FUNCTIONS
- INTEGRATED FILTERS (TRAP, BANDPASS, CLOCHE)
- INTEGRATED LUMINANCE DELAY LINE
- PAL/SECAM CHROMA DEMODULATORS
- AUTOMATIC CUT-OFF CURRENT LOOP
- TWO RGB INPUTS
- SVHS SWITCH
- TWO PLLs HORIZONTAL DEFLECTION
- VERTICAL COUNT DOWN
- VERY FEW EXTERNAL COMPONENTS

DESCRIPTION

The STV2112B is a fully bus controlled IC for TV luma, chroma and deflection processing.

Used with STV8224 (PIF/SIF/switches), TDA1771 or TDA8174 (frame booster), STV2180 (delay line), it allows to design a PAL/SECAM (BGDKIL) set with very few external components and no adjustment.

SHRINK42
(Plastic Package)

ORDER CODE : STV2112B

BLOCK DIAGRAM

FUNCTIONAL DESCRIPTION

1 - DEFLECTION CIRCUIT

Note : [X,Y] : line number referred to the internal line counter numbering

- Fully integrated synch. separator, with a low pass filter, a black level alignment of the Y/CVBS input, a slicing level at 2/3, 1/3 of the sync. pulse amplitude.
 - Frame sync. pulse locked on $2 f_H$ frequency to perfect interlace.
 - 500kHz VCO with an external ceramic resonator.
 - Two phase locked loops
 - the first PLL locks the VCO on the video signal frequency,
 - the second PLL compensates the line transistor storage time.
 - Three time constants for the first PLL.
 - the long time constant is used for normal operation
 - the short time constant is automatically used during the frame retrace and in search mode of VCR when the frame pulse is outside [258,264] and [309,314].
 - very long time constant when no video recognition
- Time constants in normal operation (automatic selection of time constants) :
- 50Hz input signal :
- short time constant : [306, 21]
 - long time constant : the rest of the field
 - inhibition of the first PLL :
the first locked loop is opened from line 309 to line 4.5 (or 314) in 50Hz mode.
 - the time constants values are chosen by means of external components.
 - possibility to force the short time constant through the bus.
 - possibility to force the very long time constant through the bus.
- Video identification : coincidence detector between the line synchro top and a line frequency window from the first PLL. The video identification status is available in the output register of the I²C bus decoder.
 - Generation of burst gate pulses and line frequency signals from the first PLL to drive the chroma and video circuits. The burst gate pulse is also sent to the sandcastle generator.
 - Frame synchro window :
[248, 352] catching
 - Field frequency selection windows :
[288, 352] 50Hz mode selection window
 - frame blanking pulse :
from line 0 to 21 in 50Hz mode
 - Vertical output pulse is 10.5 lines long.
 - Horizontal output pulse : 28μs line pulse on an open collector output;
 - Start up circuit : the horizontal output is at a high

level when V_{CC} increases from 0 to 6.8V. On shutting down, horizontal pulses are disabled when V_{CC} is below 6.2V.

- Soft-start circuit : the duty cycle of the horizontal output is 78 % ($T_{high}/(T_{high} + T_{low})$) when V_{CC1} is lower than ($0.75 \times V_{CC2}$), during the rising time. During the falling time, a 78% duty cycle HOUT pulse is provided when V_{CC1} is lower than ($0.60 \times V_{CC2}$).
- Possibility to disable the horizontal output pulse through the bus (force a high level on HOUT).
- Horizontal position adjustment controlled by bus.
- Bus controlled output voltage to adjust the vertical amplitude ; this voltage permits to adjust the slope of the vertical sawtooth generated by the external frame booster.
- Bus controlled vertical position ; the high level of the vertical pulse permits to adjust the vertical position.
- Bus controlled 4/3-16/9 selection : the low level of the vertical pulse is 0.1V when 16/9 is selected, 2V when 4/3 is selected.
- Combined flyback input and sandcastle output (Pin 37). Two thresholds on LFB/SCO Pin : The lowest threshold (0.7V) permits to extract the line blanking pulse ; the highest threshold (2V) permits to extract the line pulse for PLL2. The sandcastle signal at Pin 37 is used to control the external baseband chroma delay line.

2 - FILTERS

- Integrated trap filter :

$$Q = \frac{1}{\frac{f_0}{f_{-3dB}} - \frac{f_{-3dB}}{f_0}} \quad \begin{array}{l} Q = 1.7 \text{ at sharp. min} \\ Q = 3.0 \text{ at sharp. max} \end{array}$$

Center frequency :

- 4.43MHz for PAL
- 4.25MHz, for SECAM ($f_{-3dB} = 3\text{MHz}$; -20dB rejection between 4.1MHz and 4.4MHz)
- Integrated chroma bandpass :
 $Q = 3.5$, Center frequency = 4.43MHz
- Integrated cloche filter for SECAM :
 $Q = 16$, Center frequency = 4.286MHz
- Integrated delay line : Bandwidth = 8MHz
- Integrated low pass filter for deflection part.
- All filters are tuned with a reference phase locked loop. The PLL consists of a lowpass filter, a phase comparator, a loop filter (with an external capacitor). The reference signal is the continuous carrier wave from the VCO (4.43MHz). The PLL adjusts the center frequency of the lowpass so that it is equal to the reference signal. The tuning voltage of the PLL is used to adjust all other filters. The cloche filter is fine tuned with a second PLL operating during frame retrace.

FUNCTIONAL DESCRIPTION (continued)**3 - VIDEO CIRCUIT**

- 2 RGB inputs : RGB (OSD) input has priority against the RGBext. Maximum contrast on RGB (OSD). -12dB range contrast control on RGBext. Possibility to disable the RGBext insertion through the bus.
- Oversize blanking capability on FB(OSD)(Pin15) input. The RGB outputs will be blanked when the voltage on Pin 15 will exceed the second threshold at 1.9V (blanking threshold) : the whole field is blanked but not the inserted cut-off pulses. The OSD insertion threshold is 0.7V.
- Automatic cut-off current loop : 2V cut-off range. Sequential cut-off current measurement during the three lines after the frame blanking signal. Leakage current measurement during the frame blanking, memorization on an internal capacitor.
- Warm up detector.
- Beam current limiter DC voltage input. The beam current limiter control voltage will act on contrast first, then the brightness will be decreased when contrast attenuation reaches -5dB.
- Bus control of the red, green and blue channel gain (White point adjustment)
- Bus control of the red and green DC levels (black point adjustment)
- PAL and SECAM matrix).
- Switch-off of the trap filter in SVHS mode.
- Bus controlled contrast on luminance (20dB range)
- Bus controlled saturation (50dB range)
- Bus controlled brightness : 40% range at maximum contrast.
- Bus controlled sharpness (peaking) ; sharpness active in PAL standard only.
- Noise coring function on sharpness.

4 - CHROMA CIRCUIT**4.1 - PAL/SECAM Decoders**

- SVHS inputs ; bus controlled SVHS mode.
- 30dB range ACC
- Use of an external base band delay line (STV2180 recommended)
- Automatic standard identification, with possibility to force the standard through the bus.

4.2 - PAL Decoder

- ACC done by peak detector on synchronous demodulation of the burst
- Fully integrated killer functions.
- VCO using crystal 4.43MHz
XTAL SPECIFICATION :
Frequency :
4.433619MHz (PAL/SECAM)

Vibration mode : Fundamental, series resonance (no serial capacitor)
 Motional capacity : $13\text{fF} \pm 3\text{fF}$
 Resonance resistance : $< 70\Omega$
 Shunt capacitance : $< 7\text{pF}$
 Spurious response : No resonance at $3 \cdot f_0 \pm 3\text{kHz}$
 - 0° and $\pm 90^\circ$ demodulation angles for PAL

4.3 - SECAM Decoder

- ACC
- Fully integrated killer
- Two integrated discriminators with two PLL
- Integrated deemphasis

4.4 - Standard Identification

- Sequential identification.
- 2 identification sequences :
PAL mode, SECAM mode
- PAL priority
- the SECAM mode is locked after two identified SECAM sequences
- the SECAM mode can be selected in 50Hz only
- Blanking of the (R-Y) and (B-Y) outputs during color search mode.

5 - OTHER FUNCTIONS : IF CONTROLS**5.1 - Volume Control and Mute**

The volume control voltage range on Pin 10 is from 0.5V to 5V.

A low voltage on Pin 10 (below 0.2V) will mute the FM demodulator of the IF circuit STV8224.

It will put the volume at the minimum level and thus there will be no sound either in TV mode or SCART mode.

The volume control voltage and the mute level are controlled by the bus.

5.2 - IF Standard and TV/SCART Mode Selection

The selection of IF standard (positive or negative vision modulation) and the TV/SCART mode is controlled by the bus. The selection is converted in four voltages on Pin 21.

The lowest voltage selects the TV mode and the NEGATIVE vision modulation.

The highest voltage (open collector output with internal pull-up resistor to V_{CC}) selects the SCART mode and the NEGATIVE vision modulation.

The two other intermediate voltages select either TV mode and POSITIVE vision modulation or SCART mode and POSITIVE vision modulation.

f_{Trap}	Trap Frequency PAL		-0.2	f_{osc}	+0.2	MHz
	Trap Frequency SECAM		-0.2	4.25	+0.2	MHz
Q_{Trap}	Trap Quality Factor ($Q=1/(f_o/f-3dB - f-3dB/f_o)$)	Sharpness Min. Sharpness Max.		1.7 3		- -
CR_{ejPN}	Color Subcarrier Rejection	PAL mode, Sharpness Min.	20			dB
CR_{ejS}	Color Rejection SECAM Mode	at 4.1MHz at 4.4MHz	18 18			dB dB

CHROMINANCE BANDPASS

f_C	Center Frequency		-0.25	f_{osc}	+0.25	MHz
Q_{BP}	Bandpass Quality Factor		2.8	3.5	4.2	-

CLOCHE FILTER

f_{Cloche}	Resonant Frequency			4.286		MHz
Q_{Cloche}	Cloche Quality factor		14	16	18	-

ACC CAPACITOR (Pin 5)

I_{C5}	Charging Current	During burst gate window		250		μA
I_{L5}	Leakage Current			0.2	1	μA

CHROMA PLL (Pins 2-3)

CR_{2-3}	Catching Range	$Q = 4.43MHz$ (Pin 3)		± 600		Hz
------------	----------------	-----------------------	--	-----------	--	----

ELECTRICAL CHARACTERISTICS ($V_{CC} = 9V$, $T_{amb} = 25^{\circ}C$, unless otherwise specified) (continued)

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
PLL LOOP FILTER (Pin 4)						
I_{C4}	Control Current	During burst gate window		400		μA
I_{L4}	Leakage Current				5	μA

COLOR DIFFERENCE OUTPUT SIGNALS (Pins 40-41)

PAL DEMODULATOR						
V_{P40}	R-Y Output signal Amplitude (Pin 40)	RED-BLUE axes = 90° 100/75 colour bar	0.40	0.52	0.60	V_{PP}
V_{P41}	B-Y Output Signal Amplitude (Pin 41)	RED-BLUE axes = 90° 100/75 colour bar	0.50	0.66	0.80	V_{PP}
G_{PAL}	Gain Ratio of both Demodulators (B-Y)/(R-Y)	RED-BLUE axes = 90° 100/75 colour bar	1.15	1.27	1.45	-
$V_{PND C}$	Output Voltage when colour killed		5.6	5.8	6.0	V
SECAM DEMODULATORS						
V_{S40}	R-Y Output Signal Amplitude (Pin 40)	100/75 Colour Bar	0.8	1.05	1.20	V_{PP}
V_{S41}	B-Y Output Signal Amplitude (Pin 41)	100/75 Colour Bar	1.00	1.33	1.40	V_{PP}
G_{SECAM}	Gain Ratio of both Demodulators (B-Y)/(R-Y)		1.00	1.27	1.35	-
$V_{SD C}$	Output Voltage when colour killed		5.4	5.6	5.8	V
PAL /SECAM MATRIX						
G/R	(G-Y)/(R-Y)		-0.6	-0.51	-0.4	-
G/B	(G-Y)/(B-Y)		-0.28	-0.19	-0.15	-

SATURATION CONTROL

$SAT_{Max.}$	Maximum Saturation Control (3F)	$1V_{PP}$ CVBS on Pin 20	5	+6.5	8	dB
$SAT_{Nom.}$	Nominal Saturation Control (20)	$1V_{PP}$ CVBS on Pin 20		0		dB
$SAT_{Min.}$	Minimum Saturation Control(00)	$1V_{PP}$ CVBS on Pin 20		-44		dB

COLOUR DIFFERENCE INPUT SIGNALS (Pins 38-39)

$DCRYI$	DC Voltage Pin 39	No colour	2.6	2.8	3.0	V
$DCBYI$	DC Voltage Pin 38	No colour	2.6	2.8	3.0	V
$VR YI$	Input Signal Amplitude Pin 39	100/75 color bar		1.05		V_{PP}
$VB YI$	Input Signal Amplitude Pin 38	100/75 color bar		1.33		V_{PP}
$I_{CL38-39}$	Clamping Current	During burst key		150		μA

SYNC. SEPARATOR

V_{Sync}	Sync. Pulse Amplitude	On Pin 20	50	300		mV
------------	-----------------------	-----------	----	-----	--	----

HORIZONTAL OSCILLATOR

f_{H50}	Frequency after Divider	50Hz input signal		15625		Hz
f_{Rang}	Frequency Control Range	Low Frequency High Frequency	14500 16100	14850 16300	15200 16500	Hz Hz
f_{free}	Free Running Frequency when PLL1 open	Value 03hex in register 0Ehex	15000	15800		Hz

FIRST LOOP FILTER (Pin 33)

I_{LOW-33}	Long Time Constant Output Current		0.12	0.15	0.18	mA
I_{HIGH}	Short Time Constant Output Current		0.35	0.45	0.55	mA
I_{VLOW}	Very Long Time Constant		0.02	0.03	0.05	mA

SECOND CONTROL LOOP

CRQ_2	Control Range from Start of Horizontal Output to Flyback	Horizontal position centered		2 to 14		μs
t_{shift}	Horizontal Shift Range		4			μs

2112B-06.TBL

ELECTRICAL CHARACTERISTICS ($V_{CC} = 9V$, $T_{amb} = 25^{\circ}C$, unless otherwise specified) (continued)

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
LINE FLYBACK INPUT/SANDCASTLE OUTPUT (Pin 37)						
V_{SCO}	Output Voltage during Burst Key		4.0	5.0		V
V_{CL37}	Clamped Input Voltage during Flyback			2.5	3.1	V
t_{WBG}	Burst Key Pulse Width		3.7	3.8	3.9	μs
t_{dBG}	Delay of Start of Burst Key to Start of Sync.			5.2		μs
V_{TH1-37}	Blanking Threshold Voltage		0.5	0.7	0.9	V
V_{TH2-37}	PLL2 Threshold Voltage referred to Line Level V_{CL37}	$PLL2V_{TH}/V_{CL37}$		80		%
I_{37}	Input Current	During flyback pulse	0.1		1	mA

HORIZONTAL OUTPUT (Pin 36)

T_{W36}	Output Pulse Width	Normal operation	26	28	30	μs
V_{Low36}	Voltage Output Low	R pull-up = $1k\Omega$		1.1		V
$V_{CC\ Start}$	$V_{CC\ Start}$ Level	Voltage on Pin 42		6.7		V
$V_{CC\ Stop}$	$V_{CC\ Stop}$ Level : hysteresis	Voltage on Pin 42, $V_{CCstart} - V_{CCstop}$		0.60		V
$I_{36\ Max.}$	Maximum Allowed Output Current				10	mA
$V_{36\ Max.}$	Maximum Allowed Output Voltage (open collector)				12	V
T_{ss}	Output Pulse Duty Cycle in soft-start mode (Thigh/(Thigh + Tlow))	$V_{CC2} = 9V$, $V_{CC1} < 6.0V$ (V_{CC1} rising)		78		%

VERTICAL OUTPUT (Pin 35)

T_{W35}	Output Pulse Width			10.5		Lines
V_{Low35}	Low Level Output Voltage 4/3 Low Level Output Voltage 16/9	XXXX0XXX (bin) in Reg. 0Ehex XXXX1XXX (bin) in Reg. 0Ehex	1.5	2 0.1	2.5 0.5	V V
FR35	Locking Range		248		352	Lines
f_{FR-50}	Free Frequency (no Video Signal)	50Hz		314		Lines
V_{HIGH35}	High Level Range (vertical position control)	XXXXX000(bin) in Reg. 0Dhex XXXXX111(bin) in Reg. 0Dhex	3.5 5.7	3.8 6.3	4.2 7.0	V V
I_{sink}	Output Sinking Current	4/3 16/9		0.2 0.5		mA mA

VERTICAL AMPLITUDE CONTROL (Pin 34)

V_{34R}	Output Voltage Range	XX000000(bin) in Reg. 0Chex XX111111(bin) in Reg. 0Chex	1.0 5.6	1.2 6.2	1.5 6.7	V V
-----------	----------------------	--	------------	------------	------------	--------

VOLUME CONTROL AND MUTE (Pin 10)

V_{R10}	Output Voltage Range (volume control)	XX000000(bin) in Reg. 0Fhex XX111111(bin) in Reg. 0Fhex	0.35 4.2	0.5 4.7	0.7 5.2	V V
MUT	Output Voltage when MUTE			0.02	0.1	V

2112B-07.TBL

ELECTRICAL CHARACTERISTICS ($V_{CC} = 9V$, $T_{amb} = 25^{\circ}C$ unless otherwise specified) (continued)

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
IF STANDARD CONTROL & SWITCH SELECTION (Pin 11)						
$V_{TV/NEG}$	Output Voltage in TV Mode and Negative Vision Modulation	$V_{CC} = 9V$		0.1	0.7	V
$V_{TV/POS}$	Output Voltage in TV Mode and Positive Vision Modulation	$V_{CC} = 9V$	2.90	3.37	3.80	V
$V_{Start/Pos}$	Output Voltage in SCART Mode and Positive Vision Modulation	$V_{CC} = 9V$	5.20	5.62	6.10	V
$V_{Start/Neg}$	Output Voltage in SCART Mode and Negative Vision Modulation (open collector mode)	$V_{CC} = 9V$	7.88	9		V
$R_{TV/Neg}$	Output Resistance in TV Mode and Negative Vision Modulation			200		Ω
$R_{TV/Pos}$	Output Resistance in TV Mode and Positive Vision Modulation			6.7		$k\Omega$
$R_{Scart/Pos}$	Output Resistance in Scart Mode and Positive Vision Modulation			11		$k\Omega$
$R_{Scart/Neg}$	Output Resistance in Scart Mode and Negative Vision Modulation (pull-up resistor to V_{CC})			18		$k\Omega$

I²C BUS INPUTS (Pins 6-7)

V_{TH6-7}	Threshold Voltage		1.5	2.25	3	V
C_{L6-7}	Capacitance of each Pin			5	10	pF
$I_{Leak6-7}$	Leakage Current	Write Mode, 0 level on SDA or SCL			50	μA

APPLICATION DIAGRAM

- Notes :**
- STV2112B requires only 1 XTAL (4.43MHz).
 - Recommended 4.43MHz XTAL is JAUCH Number 10080082.
 - XTAL2 selection pin (Pin 2) : we recommend the connection to VCC2 (Pin 42). In the case of STV2112B version, this pin can be left open.

110° CRT APPLICATIONS : Vertical System with East-West
