Product Description

The AP562 is a high dynamic range broadband power amplifier in a surface mount package. The single-stage amplifier has 11.5 dB gain, while being able to achieve high performance for 3.3–3.8 GHz WiMAX applications with up to 39.4 dBm of compressed 1dB power.

The AP562 uses a high reliability +12V InGaP/GaAs HBT process technology. The device incorporates proprietary bias circuitry to compensate for variations in linearity and current draw over temperature. The device does not require any negative bias voltage; an internal active bias allows the AP562 to operate directly off a commonly used +12V supply and has the added feature of a +5V power down control pin. RoHS-compliant 5x6mm DFN package is surface mountable to allow for low manufacturing costs to the end user.

The AP562 is targeted for use in a balanced or single ended configuration for WiMAX applications where high linearity and high power is required.

Notes:
1. Please note that for reliable operation, the evaluation board will have to be mounted to a much larger heat sink during operation and in laboratory environments to dissipate the power consumed by the device. The use of a convection fan is also recommended in laboratory environments.
2. The area around the module underneath the PCB should not contain any soldermask in order to maintain good RF grounding.
3. For proper and safe operation in the laboratory, the power-on sequencing is recommended.
