

## Features

- PowerPC 60x/7xx bus.
  - 66.66 MHz
  - 83.33 MHz
- Synchronous DRAM interface operates at the processor bus speed with support for ECC.
- PCI Revision 2.1 Compliant Interface.
- ROM/SRAM/External peripheral controller.
- Interrupt Controller supports interrupts from a variety of sources.
- Programmable Timers.
- Two 2-wire, 8-bit, 16550 compatible UARTs.
- Two independent IIC interfaces.
- Byte swapping supported for bi-endian operation.
- Internal PCI Bus Arbiter for PCI bus speeds up to 33.33 MHz (may be disabled for use with an external arbiter).
- 32-bit PCI bus operates at frequencies from 25MHz to 66.66 Mhz.
- Uses standard type 0 PCI configuration register map essential to making it appear like a device but does not preclude it from being a host.
- Supports independent primary and secondary resource management mapping. This feature enables the CPC700 to effectively isolate local processing resources from host side memory and I/O allocations. Through the use of three independent translation decodes, the PowerPC operating environment access to PCI is managed solely by the PowerPC.
- Dual address capabilities enhance the CPC700's capabilities by allowing it to manage, control, or test beyond 4GB limitations.
- Support for shared memory is locally mapped to the processor's ROM or SDRAM through PCI standard Base Address Registers. Two Memory I/O BARs are available for requesting host memory or I/O resources and managing PCI to PowerPC access.
- Provides a special interface enabling the CPC700 to generate any PCI command, including Type 1 configuration cycles.
- Fully buffers PCI writes and supports PCI read pre-fetching from local memory.
- Hardware enforces cache coherency.
- Implemented in CMOS5SE.

## 1. Description

The CPC700 contains a bridge from the PowerPC processor to the PCI bus, as well as a high-speed memory controller, internal peripherals, and control for external ROM and external peripherals. The CPC700 is a general purpose solution for interfacing the high performance, superscalar, PowerPC 603e, 740, and 750 families of RISC microprocessors to a PCI bus and system memory.

### CPC700 Embedded Bridge Functional Block Diagram

## 2. Electrical Characteristics

### Absolute Maximum Ratings

Characteristic	Symbol	Value	Unit
Supply Voltage	$V_{DD}$	0 to 3.6	V
PLL0 Supply Voltage	$AV_{DD0}$	0 to 3.6	V
PLL1 Supply Voltage	$AV_{DD1}$	0 to 3.6	V
Input Voltage	$V_{IN}$	0 to 3.6	V
Storage Temperature Range	$T_{STG}$	-65 to 150	°C

### Recommended DC Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Supply Voltage	$V_{DD}$	3.135	3.3	3.465	V	
PLL0 Supply Voltage	$V_{DD}$	3.135	3.3	3.465	V	
PLL1 Supply Voltage	$V_{DD}$	3.135	3.3	3.465	V	
Input Logic High (3.3V receivers)	$V_{IH}$	2.0		$V_{DD}$	V	
Input Logic High (5.0V receivers)	$V_{IH}$	2.0		5.50	V	
Input Logic Low	$V_{IL}$	0.0		0.8	V	
Output Logic High	$V_{OH}$	2.4		$V_{DD}$	V	
Output Logic Low	$V_{OL}$	0.0		0.4	V	
Input Leakage Current Group 1	$I_{IL1}$	—	<1	10	µA	2
Input Leakage Current Group 2	$I_{IL2}$	—	—	400	µA	3
Input Leakage Current Group 3	$I_{IL3}$	—	—	-250	µA	4
Input Max Allowable Overshoot (3.3V receivers)	$V_{IMAO3}$			$V_{DD} + 0.6$	V	
Input Max Allowable Overshoot (5.0V receivers)	$V_{IMAO5}$			5.50	V	
Input Max Allowable Undershoot (3.3V receivers)	$V_{IMAU3}$			-0.60	V	
Input Max Allowable Undershoot (5.0V receivers)	$V_{IMAU5}$			-0.60	V	
Output Max Allowable Overshoot (3.3V receivers)	$V_{OMAO3}$			$V_{DD} + 0.6$	V	
Output Max Allowable Overshoot (5.0V receivers)	$V_{OMAO5}$			5.50	V	
Output Max Allowable Undershoot (3.3V receivers)	$V_{OMAU3}$			-0.60	V	
Die Junction Temperature	$T_J$	-40		105	°C	

1. Refer to the Output Signal Power Ranges Table for power information.
2. Input leakage currents for all inputs except those indicated in Notes 3 and 4.
3. Input leakage current for signals TEST\_ENABLE, GBL\_N, TSIZ[0], TSIZ[1], TT[0], AND TT[4].
4. Input leakage current for signals TSIZ[2], TT[1], TRST\_N, TDI, TMS, TCK, DI1, AND DI2.
5. In addition to any other specification herein, all CPC700 PCI bus I/Os meet or exceed the PCI v2.1 requirements for 3.3V and 5.0V signalling environments.

## Capacitance

Parameter	Symbol	Min	Max	Unit	Notes
Input Capacitance Group 1	CIN1	—	5	pF	1, 3
Input Capacitance Group 1	CIN2	—	8	pF	2, 3

1. Group 1 includes all signals except those indicated in note 2.  
2. Group 2 includes GBL\_N, TSIZ[0], TSIZ[1], TT[4], and TT[0].  
3. Excludes test signals TEST\_ENABLE, DI1\_N, DI2\_N, RI\_N, and JTAG signals.

## DC Electrical Characteristics

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Thermal Resistance, Junction to Ambient				15	°C/W	1
Thermal Resistance, Junction to Balls				5.9	°C/W	1,2
Active Operating Current	I <sub>DD</sub>			420 (66.66 MHz) 500 (83.33 MHz)	mA	3
PLL0 Voltage	V <sub>PLL0</sub>	3.135	3.3	3.465	V	
PLL0 VDD Input current	I <sub>PLL0</sub>			14	mA	
PLL1 Voltage	V <sub>PLL1</sub>	3.135	3.3	3.465	V	
PLL1 VDD Input current	I <sub>PLL1</sub>			14	mA	

1. Under normal operating conditions, the CPC700 does not require a heat sink.  
2. Measured from junction to outside corner ball.  
3. I<sub>DD</sub> Max is measured at T<sub>c</sub> = 105 °C, worst case operating conditions for frequency and voltage, and a capacitive load of 50 pF.

## Power

Power	Processor/Memory Frequency		Units	Notes
	66.66	83.33		
Typical	1.1	1.2	W	1, 2
Maximum	1.6	1.9	W	2, 3, 4

1. Typical power is measured at VDD=3.3V, 27°C in a system executing typical sequences.
2. Guaranteed by design and characterization and is not tested.
3. Maximum power is measured at VDD=3.6V, 120°C in a system executing worse case sequences with the CPU caches disabled
4. Maximum power at – 40°C can be derived by subtracting 0.05 W from the maximum power number at 120°C.

1. Timing is guaranteed by design and characterization and is not tested.  
 2. All I/O timing (CPU, PCI, and other) is specified into a 50pF load. All timings include errors (if any) induced by internal PLLs, given a clock input with no jitter.  
 Sys (2X): Timings shown are referenced to the rising edge of the output of PLL0, operating at twice the frequency of the SYS\_CLK input. PLL0 locks to the rising edge of SYS\_CLK.  
 Sys (1X): Timing is referenced to SYS\_CLK.  
 PCI (A): PCI interface in asynchronous mode. Timings are referenced to the PCI\_CLK input. Logic is clocked by the output of PLL1, which repeats PCI\_CLK.  
 PCI (S): PCI interface in synchronous mode. Timings are referenced to the SYS\_CLK, which is assumed to be exactly equal to the PCI clock.  
 3. Asynchronous PCI timings reflect 66.66 MHz PCI operation. Output timings are specified into a 50pF load.  
 4. PCI in 2:1 (CPU @ 66.66MHz, PCI @ 33.33 MHz).  
 5. All PCI timings meet or exceed PCI v2.1 specifications. System designers should design using the PCI timing budgets of the PCI version 2.1 specifications. Output delays are specified into a 50pF lumped load model.  
 6. IIC output timing specified into a 250pF load.  
 7. This is a 5.0V receiver. Other receivers are 3.3V receivers.

## Common I/O Specifications for 66.66MHz and 83.33MHz (Part 2 of 3)

Signal	I/O	Input (ns)		Output (ns)		Output Current (mA)		Clock	Notes

<b>Miscellaneous</b>									
RESET_OUT_N	O					19	16	Sys (2X)	
IRQ_OUT_N	O					10.2	6.8		
TDO	O					10.2	6.8		

1. Timing is guaranteed by design and characterization and is not tested.  
 2. All I/O timing (CPU, PCI, and other) is specified into a 50pF load. All timings include errors (if any) induced by internal PLLs, given a clock input with no jitter.  
   Sys (2X): Timings shown are referenced to the rising edge of the output of PLL0, operating at twice the frequency of the SYS\_CLK input. PLL0 locks to the rising edge of SYS\_CLK.  
   Sys (1X): Timing is referenced to SYS\_CLK.  
   PCI (A): PCI interface in asynchronous mode. Timings are referenced to the PCI\_CLK input. Logic is clocked by the output of PLL1, which repeats PCI\_CLK.  
   PCI (S): PCI interface in synchronous mode. Timings are referenced to the SYS\_CLK, which is assumed to be exactly equal to the PCI clock.  
 3. Asynchronous PCI timings reflect 66.66 MHz PCI operation. Output timings are specified into a 50pF load.  
 4. PCI in 2:1 (CPU @ 66.66MHz, PCI @ 33.33MHz).  
 5. All PCI timings meet or exceed PCI v2.1 specifications. System designers should design using the PCI timing budgets of the PCI version 2.1 specifications. Output delays are specified into a 50pF lumped load model.  
 6. IIC output timing specified into a 250pF load.  
 7. This is a 5.0V receiver. Other receivers are 3.3V receivers.

IRQ [0:11], RESET\_N, and PCI\_66\_STRAP are asynchronous inputs that use 5.0V receivers. Timing to the clock and output characteristics are not specified for these pins.

There is an internal 13KΩ pull-down resistor connected to pin TEST\_ENABLE.

There are internal 13KΩ pull-down resistors connected to pins GBL\_N, TSIZ [0:1], TT [0], and TT [4].

There are internal 20KΩ pull-up resistors connected to pins TSIZ [2] and TT [1].

WE_N	O			5.7	2.4	19	16	Sys (2X)	

1. Timing is guaranteed by design and characterization and is not tested.
2. All I/O timing (CPU, PCI, and other) is specified into a 50pf load. All timings include errors (if any) induced by internal PLLs, given a clock input with no jitter.  
Sys (2X): Timings shown are referenced to the rising edge of the output of PLL0, operating at twice the frequency of the SYS\_CLK input. PLL0 locks to the rising edge of SYS\_CLK.  
Sys (1X): Timing is referenced to SYS\_CLK.
- PCI (A): PCI interface in asynchronous mode. Timings are referenced to the PCI\_CLK input. Logic is clocked by the output of PLL1, which repeats PCI\_CLK.
- PCI (S): PCI interface in synchronous mode. Timings are referenced to the SYS\_CLK, which is assumed to be exactly equal to the PCI clock.
- This is a 5.0V receiver. Other receivers are 3.3V receivers.
- This output mimics an open collector gate and requires a pull-up resistor.
- TBST\_N is never driven low. TBST\_N is driven high on snoops.
- GBL\_N is not sampled.

## Clock DC Specifications

Signal Name	Minimum Vih	Maximum Vil	Cin
SYS_CLK	2.0V	0.8V	5pf
PCI_CLK	2.0V	0.8V	5pf

## CPC700 - 66 Clock AC Specifications

Signal Name	Input		Jitter		Duty Cycle		Notes
	Fmin	Fmax	Short	Long	Min	Max	
SYS_CLK	30 MHz	33.33MHz	±150ps	±250ps	40%	60%	3
PCI_CLK	25 MHz	66.66MHz	±150ps	±250ps	40%	60%	

1. In the clock tables, 25 MHz represents 1/(40ns), 33.33MHz represents 1/(30ns), 41.66MHz represents 1/(24ns), 66.66MHz represents 1/(15ns), and 83.33MHz represents 1/(12ns).
2. For information on CPC700 operation with a spread spectrum clock, please contact your IBM technical representative.

## CPC700 - 83 Clock AC Specifications

Signal Name	Input		Jitter		Duty Cycle		Notes
	Fmin	Fmax	Short	Long	Min	Max	
SYS_CLK	30MHz	41.66MHz	±150ps	±250ps	40%	60%	3
PCI_CLK	25MHz	66.66MHz	±150ps	±250ps	40%	60%	

1. In the clock tables, 25MHz represents 1/(40ns), 33.33MHz represents 1/(30ns), 41.66MHz represents 1/(24ns), 66.66MHz represents 1/(15ns), and 83.33MHz represents 1/(12ns).
2. For information on CPC700 operation with a spread spectrum clock, please contact your IBM technical representative.
3. In previous versions of this data sheet, SYS\_CLK Fmin was incorrectly listed as 10 MHz.

IBM25CPC700DB3A83Z	88H3990	83.33	Tape and Reel	dd 1.3

**Note 1:** Previous versions of this document contained an error in the OEMLS part numbers of the parts shown. The 45L7531, 09K4299, and 09K4298 part numbers showed a "B" in the Application Conditions field, instead of "A", which is now shown correctly. All of these parts that were shipped by IBM were correctly marked.

**Note 2:** Part number 45L7530 has a "B" in the OEMLS part number, and is marked with a "B" on the package and in all revisions of the Datasheet. This part is actually specified for "A" application conditions. For this part number, decode the "B" to mean "Full Specification." The OEMLS part number and package marking of 45L7530 will not be changed. This part number will not be issued with any other application conditions.

The following figure provides the part numbering nomenclature for the CPC700.

**OEMLS Part Number Key**

**PowerPC**

**CPC700 Memory Controller and PCI Bridge**
