WS1105

CDMA Cell 3x3 Power Amplifier Module
(824-849 MHz)

Data Sheet

Description

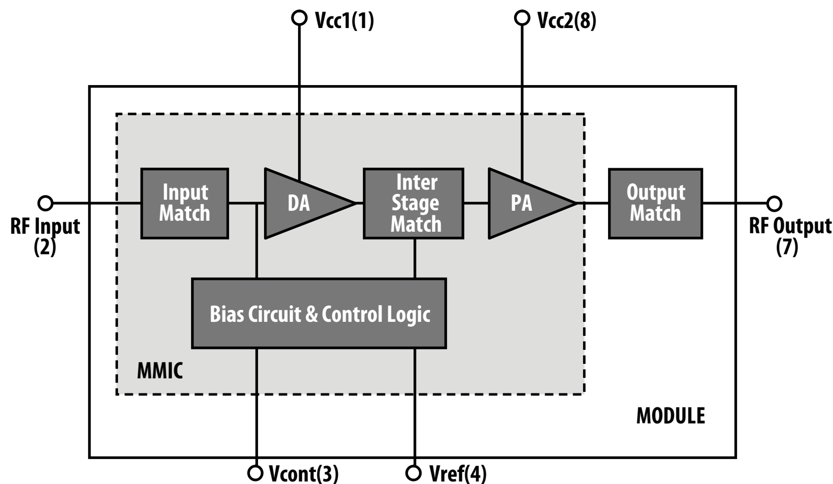
The WS1105 is a CDMA(Code Division Multiple Access) power amplifier module designed for handsets operating in the 824-849MHz bandwidth.

The WS1105 features CoolPAM circuit technology that offers state-of-the-art reliability, temperature stability and ruggedness.

Digital mode control of CoolPAM reduces current consumption, which enables extended talk time of mobile devices.

The WS1105 meets stringent CDMA linearity requirements to and beyond 28dBm output power. The 3mmx3mm form factor 8-pin surface mount package is self contained, incorporating 50ohm input and output matching networks.

Functional Block Diagram



Features

- Excellent Linearity
- Low quiescent current
- High Efficiency
  - PAE at 28dBm: 41.2%
  - PAE at 16dBm: 17.7%
- 8-pin surface mounting package
  - 3mmx3mmx1.0mm
- Internal 50ohm matching networks for both RF input and output
- RoHS Compliant

Applications

- Digital CDMA Cellular
- Wireless Local Loop

Table 1. Absolute Maximum Ratings [1]

Parameter	Symbol	Min	Nominal	Max	Unit
RF Input Power	Pin	–	–	10.0	dBm
DC Supply Voltage	Vcc	0	3.4	5.0	V
Reference Voltage	Vref	0	2.85	3.3	V
Control Voltage	Vcont	0	2.85	3.3	V
Storage Temperature	Tstg	-55	–	+125	°C

Table 2. Recommended Operating Condition

Parameter	Symbol	Min	Nominal	Max	Unit
DC Supply Voltage	Vcc	3.2	3.4	4.2	V
DC Reference Voltage	Vref	2.75	2.85	2.95	V
Mode Control Voltage					
– High Power Mode	Vcont	0	0	0.5	V
– Low Power Mode	Vcont	2.0	2.85	3.0	V
Operating Frequency	Fo	824		849	MHz
Ambient Temperature	Ta	-30	25	85	°C

Table 3. Power Range Truth Table

Power Mode	Symbol	Vref	Vcont [2]	Range
High Power Mode	PR2	2.85	Low	~ 28dBm
Low Power Mode	PR1	2.85	High	~ 16dBm
Shut Down Mode	–	0	–	–

Notes:
1. No damage assuming only one parameter is set at limit at a time with all other parameters set at or below nominal value.
2. High (2.0–3.0V), Low (0.0V–0.5V).

Peripheral Circuit in Handset

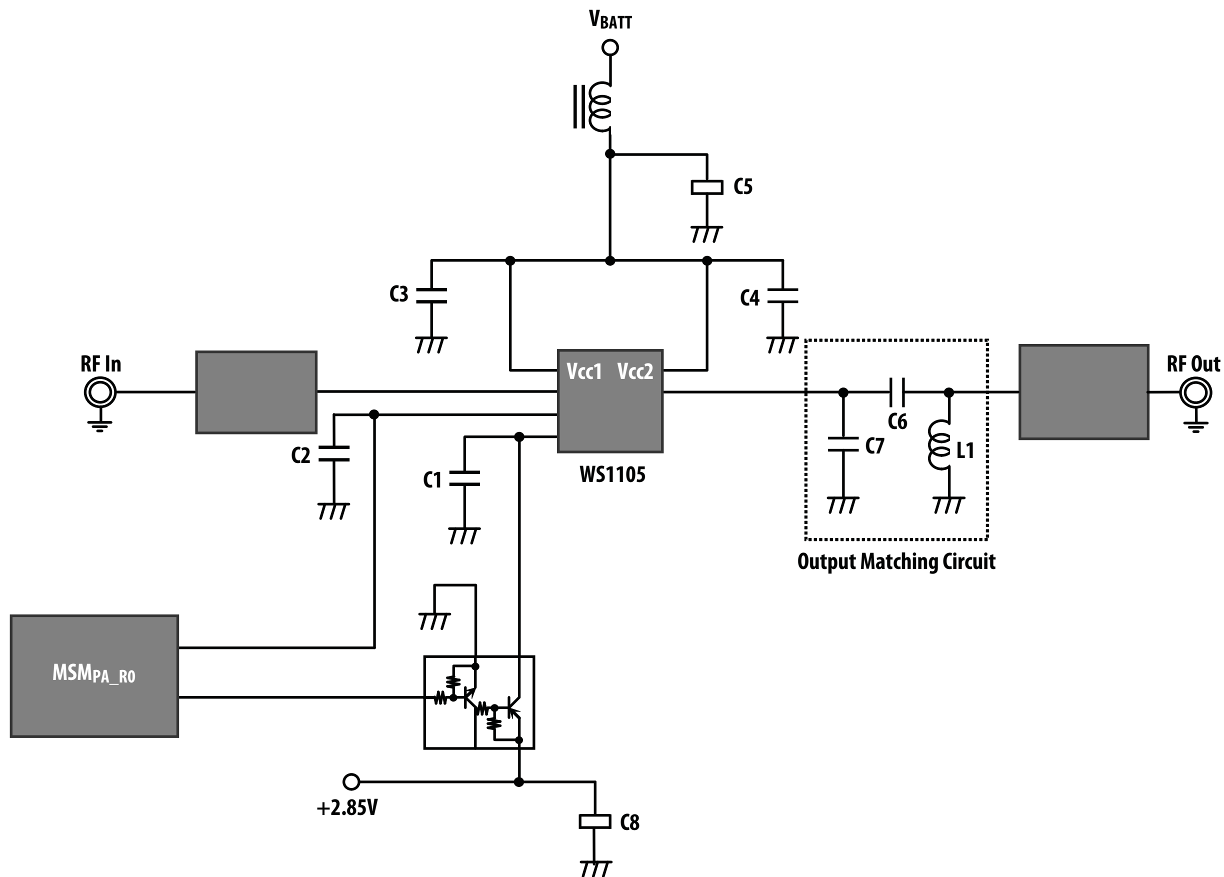

Figure 10. Peripheral circuit

Notes :
- Recommended voltage for Vref is 2.85V
- Place C1 near to Vref pin
- Place C3 and C4 close to pin 1 (Vcc1) and pin 8 (Vcc2). These capacitors can affect the RF performance
- Use 50Ω transmission line between PAM and Duplexer and make it as short as possible to reduce conduction loss
- π-type circuit topology is good to use for matching circuit between PA and Duplexer

Free Datasheet http://www.datasheet4u.com/

Calibration

Calibration procedure is shown in Figure 11. Two calibration tables, high mode and low mode respectively, are required for Cool PAM, which is due to gain difference in each mode. For continuous output power at the mode change points, the input power should be adjusted according to gain step during the mode change.

Offset value
(Difference between rising point and falling point)

Offset value, which is the difference between the rising point (output power where PA mode changes from low mode to high mode) and falling point (output power where PA mode changes from high mode to low mode), should be adopted to prevent system oscillation. 3 to 5 dB is recommended for hysteresis.

Average current & Talk time

Probability Distribution Function implies that what is important for longer talk time is the efficiency of low or medium power range rather than the efficiency at full power. WS1105 idle current is 13mA and operating current at 16dBm is 65mA at nominal condition. This PA with low current consumption prolongs talk time by no less than 30 minutes compared to other PAs

Average current = ∫ (PDF x Current)dp

PCB Design Guidelines

The recommended WS1105 PCB land pattern is shown in Figure 14 and Figure 15. The substrate is coated with solder mask between the I/O and conductive paddle to protect the gold pads from short circuit that is caused by solder bleeding/bridging.

Stencil Design Guidelines

A properly designed solder screen or stencil is required to ensure optimum amount of solder paste is deposited onto the PCB pads.

The recommended stencil layout is shown in Figure 16. Reducing the stencil opening can potentially generate more voids. On the other hand, stencil openings larger than 100% will lead to excessive solder paste smear or bridging across the I/O pads or conductive paddle to adjacent I/O pads. Considering the fact that solder paste thickness will directly affect the quality of the solder joint, a good choice is to use laser cut stencil composed of 0.100mm(4mils) or 0.127mm(5mils) thick stainless steel which is capable of producing the required fine stencil outline.

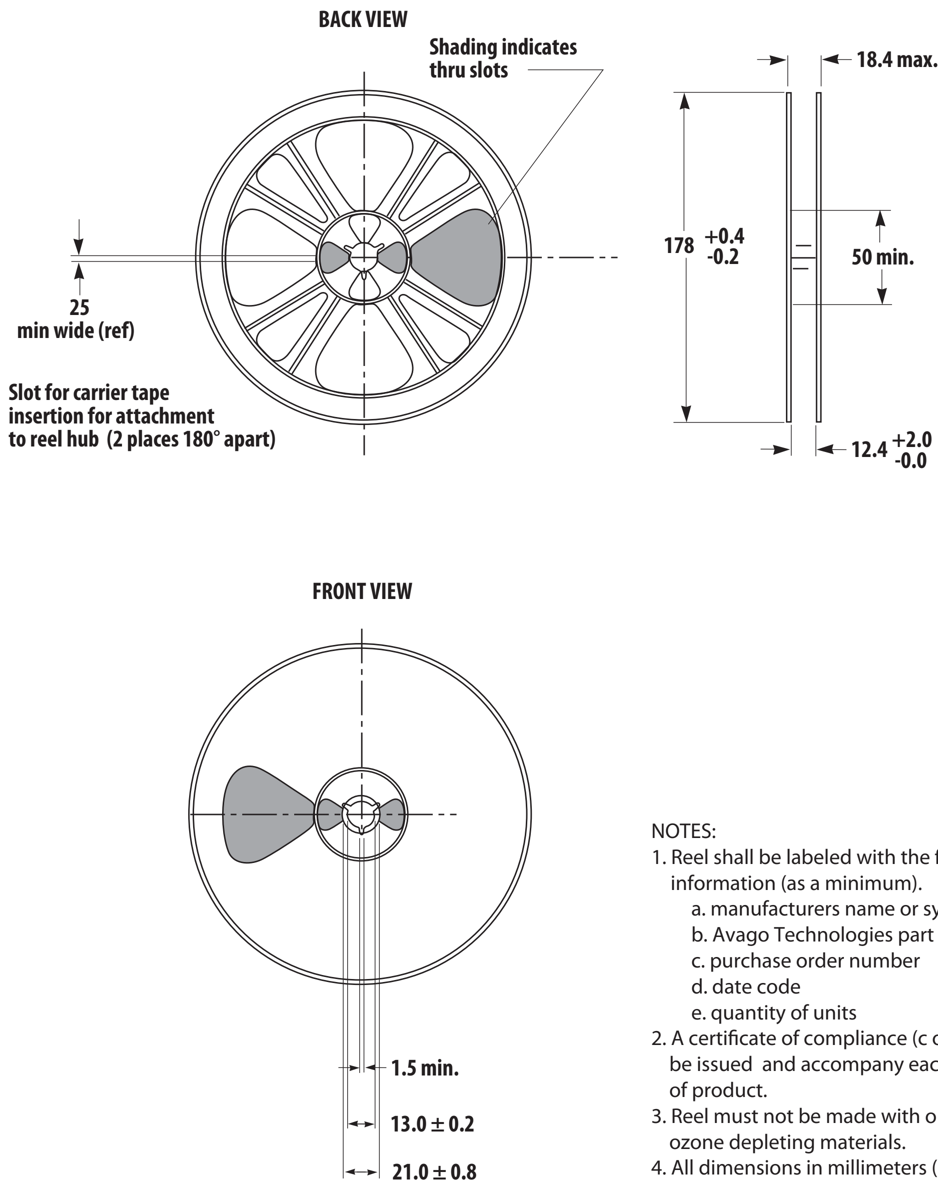
Reel Drawing



NOTES:
1. Reel shall be labeled with the following information (as a minimum).
   a. manufacturers name or symbol
   b. Avago Technologies part number
   c. purchase order number
   d. date code
   e. quantity of units
2. A certificate of compliance (c of c) shall be issued and accompany each shipment of product.
3. Reel must not be made with or contain ozone depleting materials.
4. All dimensions in millimeters (mm)

Figure 18. Plastic Reel Format (all dimensions are in millimeters)

Handling and Storage

ESD (Electrostatic Discharge)

Electrostatic discharge occurs naturally in the environment. With the increase in voltage potential, the outlet of neutralization or discharge will be sought. If the acquired discharge route is through a semiconductor device, destructive damage will result.

ESD countermeasure methods should be developed and used to control potential ESD damage during handling in a factory environment at each manufacturing site.

MSL (Moisture Sensitivity Level)

Plastic encapsulated surface mount package is sensitive to damage induced by absorbed moisture and temperature.

Avago Technologies follows JEDEC Standard J-STD 020B. Each component and package type is classified for moisture sensitivity by soaking a known dry package at various temperatures and relative humidity, and times. After soak, the components are subjected to three consecutive simulated reflows.

The out of bag exposure time maximum limits are determined by the classification test describe below which corresponds to a MSL classification level 6 to 1 according to the JEDEC standard IPC/JEDEC J-STD-020B and J-STD-033.

WS1105 is MSL3. Thus, according to the J-STD-033 p.11 the maximum Manufacturers Exposure Time (MET) for this part is 168 hours. After this time period, the part would need to be removed from the reel, de-taped and then re-baked. MSL classification reflow temperature for the WS1105 is targeted at 260°C +0/-5°C. Figure 19 and Table 7 show typical SMT profile for maximum temperature of 260 +0/-5°C.

Table 5. ESD Classification

Pin #	Name	Description	HBM	CDM	Classification
1	Vcc1	Supply Voltage	± 2000V	± 200V	Class 2
2	RFIn	RF Input	± 2000V	± 200V	Class 2
3	Vcont	Control Voltage	± 2000V	± 200V	Class 2
4	Vref	Reference Voltage	± 2000V	± 200V	Class 2
5	GND	Ground	± 2000V	± 200V	Class 2
6	GND	Ground	± 2000V	± 200V	Class 2
7	RF Out	RF Output	± 2000V	± 200V	Class 2
8	Vcc2	Supply Voltage	± 2000V	± 200V	Class 2

Note :
1. Module products should be considered extremely ESD sensitive

Table 6. Moisture Classification Level and Floor Life

MSL Level	Floor Life (out of bag) at factory ambient =< 30°C/60% RH or as stated
1	Unlimited at =< 30°C/85% RH
2	1 year
2a	4 weeks
3	168 hours
4	72 hours
5	48 hours
5a	24 hours
6	Mandatory bake before use. After bake, must be reflowed within the time limit specified on the label

Note :
1. The MSL Level is marked on the MSL Label on each shipping bag.

Storage Condition

Packages described in this document must be stored in sealed moisture barrier, antistatic bags. Shelf life in a sealed moisture barrier bag is 12 months at <40°C and 90% relative humidity (RH) J-STD-033 p.7.

Out-of-Bag Time Duration

After unpacking the device must be soldered to the PCB within 168 hours as listed in the J-STD-020B p.11 with factory conditions <30°C and 60% RH.

Baking

It is not necessary to re-bake the part if both conditions (storage conditions and out-of bag conditions) have been satisfied. Baking must be done if at least one of the conditions above have not been satisfied. The baking conditions are 125°C for 12 hours J-STD-033 p.8.

CAUTION

Tape and reel materials typically cannot be baked at the temperature described above. If out-of-bag exposure time is exceeded, parts must be baked for a longer time at low temperatures, or the parts must be de-reeled, de-taped, re-baked and then put back on tape and reel. (See moisture sensitive warning label on each shipping bag for information of baking).

Board Rework

Component Removal, Rework and Remount

If a component is to be removed from the board, it is recommended that localized heating be used and the maximum body temperatures of any surface mount component on the board not exceed 200°C. This method will minimize moisture related component damage. If any component temperature exceeds 200°C, the board must be baked dry per 4-2 prior to rework and/or component removal. Component temperatures shall be measured at the top center of the package body. Any SMD packages that have not exceeded their floor life can be exposed to a maximum body temperature as high as their specified maximum reflow temperature.

Removal for Failure Analysis

Not following the above requirements may cause moisture/reflow damage that could hinder or completely prevent the determination of the original failure mechanism.

Baking of Populated Boards

Some SMD packages and board materials are not able to withstand long duration bakes at 125°C. Examples of this are some FR-4 materials, which cannot withstand a 24 hr bake at 125°C. Batteries and electrolytic capacitors are also temperature sensitive. With component and board temperature restrictions in mind, choose a bake temperature from Table 4-1 in J-STD 033; then determine the appropriate bake duration based on the component to be removed. For additional considerations see IPC-7711 andIPC-7721.

Derating due to Factory Environmental Conditions

Factory floor life exposures for SMD packages removed from the dry bags will be a function of the ambient environmental conditions. A safe, yet conservative, handling approach is to expose the SMD packages only up to the maximum time limits for each moisture sensitivity level as shown in Table 7. This approach, however, does not work if the factory humidity or temperature is greater than the testing conditions of 30°C/60% RH. A solution for addressing this problem is to derate the exposure times based on the knowledge of moisture diffusion in the component package materials ref. JESD22-A120). Recommended equivalent total floor life exposures can be estimated for a range of humidities and temperatures based on the nominal plastic thickness for each device.

Table 9 lists equivalent derated floor lives for humidities ranging from 20-90% RH for three temperature, 20°C, 25°C, and 30°C.

This table is applicable to SMDs molded with novolac, biphenyl or multifunctional epoxy mold compounds. The following assumptions were used in calculating Table 9:

1. Activation Energy for diffusion = 0.35eV (smallest known value).
2. For ≤60% RH, use Diffusivity = 0.121exp (-0.35eV/kT) mm2/s (this used smallest known Diffusivity @ 30°C).
3. For >60% RH, use Diffusivity = 1.320exp (-0.35eV/kT) mm2/s (this used largest known Diffusivity @ 30°C).

Free Datasheet http://www.datasheet4u.com/

Table 8. Recommended Equivalent Total Floor Life (days) @ 20°C, 25°C & 30°C For ICs with Novolac, Biphenyl and Multifunctional Epoxies (Reflow at same temperature at which the component was classified)
