

AK5351

Enhanced Dual bit $\Delta \Sigma$ 20bit ADC

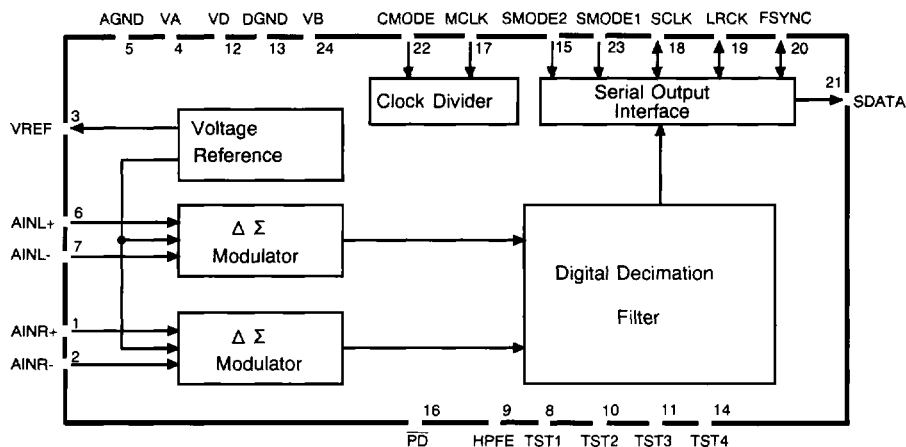

GENERAL DESCRIPTION

The AK5351 is a 20-bit, 64x oversampling rate(64fs), 2-channel A/D converter for stereo digital systems. The $\Delta \Sigma$ modulator in the AK5351 uses the new developed Enhanced Dual bit architecture. This new architecture achieves the wider dynamic range, while keeping much the same superior distortion characteristics as the conventional Single bit way. The AK5351 is suitable for digital surround and Hi-Fi audio application such as Car-audio, MD, etc. Analog inputs of the AK5351 are normally Full-differential inputs, while they are also acceptable Single-ended inputs.

The AK5351 is available in a small 24pin VSOP package which will reduce your system space.

FEATURES

- ☐ Full-differential / Single-ended inputs
- ☐ S/(N+D): 97dB
- ☐ DR, S/N: 103dB
- ☐ Linear phase digital filter
 - Pass band: 0 ~ 22kHz(@fs=48kHz)
 - Pass band ripple: ± 0.005 dB
 - Stop band attenuation: 80dB
- ☐ Digital HPF for DC-offset cancel
- ☐ Master clock: 256fs/384fs
- ☐ Power supply: 5V $\pm 10\%$
- ☐ Small package: 24pinVSOP

ABSOLUTE MAXIMUM RATINGS

(AGND,DGND=0V; Note 1)

| Parameter | Symbol | min | max | Units |
|---|--------|------|------------|-------|
| DC Power Supply: Analog Power(VA pin) | VA | -0.3 | 6.0 | V |
| Digital Power(VD pin) (Note 2) | VD | -0.3 | 6.0/VB+0.3 | V |
| Substrate Power(VB pin) | VB | -0.3 | 6.0 | V |
| Input Current (Any pin except supplies) | IIN | - | ± 10 | mA |
| Analog Input Voltage AINL+, AINL-, AINR+, AINR-pins (Note 2) | VINA | -0.3 | 6.0/VA+0.3 | V |
| Digital Input Voltage (Note 2) | VIND | -0.3 | 6.0/VB+0.3 | V |
| Ambient Temperature | Ta | -40 | 85 | °C |
| Storage Temperature | Tstg | -65 | 150 | °C |

Note 1 : All voltage with respect to ground.

Note 2 : Absolute maximum value is the highest voltage in 6.0V, VA+0.3V and VB+0.3V.

WARNING: Operation beyond these limits may result in permanent damage to the device.

Normal operation is not guaranteed at these extremes.

RECOMMENDED OPERATING CONDITIONS

(AGND,DGND=0V; Note 1)

| Parameter | Symbol | min | typ | max | Units |
|---------------------------------|--------|------|-----|------|-------|
| DC Power Supplies: Analog Power | VA | 4.50 | 5.0 | 5.50 | V |
| Digital Power(VD pin) | VD | 4.50 | 5.0 | VB | V |
| (VB pin) (Note 3) | VB | 4.50 | 5.0 | 5.50 | V |

Note 1 : All voltages with respect to ground.

Note 3 : The VA and VB are connected together through the chip substrate and have several ohms resistance. The VA and VB should be powered at the same time or earlier than VD.

※ AKM assumes no responsibility for the usage beyond the conditions in this data sheet.

ANALOG CHARACTERISTICS

(Ta=25 °C ; VA,VD,VB=5.0V; fs=48kHz; 20bit; Input signal frequency=1kHz,
Measurement Bandwidth=10Hz ~ 20kHz; unless otherwise specified.)

| Parameter | min | typ | max | Units |
|--|--------|--------|--------|---------|
| Resolution | | | 20 | Bits |
| Analog Input Characteristics (Analog source impedance: 330 Ω) | | | | |
| S/(N+D) (Note 4) | 88 | 97 | | dB |
| Dynamic Range (A-weighted) (Note 5) | 97 | 103 | | dB |
| S/N (A-weighted) (Note 6) | 97 | 103 | | dB |
| Interchannel Isolation (f=1kHz) | 100 | 120 | | dB |
| Interchannel Gain Mismatch | | 0.1 | 0.3 | dB |
| Gain drift | | ± 200 | | ppm/ °C |
| Input Voltage Range | ± 1.97 | ± 2.10 | ± 2.23 | Vp-p |
| Input Impedance | 30 | 50 | | k Ω |
| Power Supplies | | | | |
| Power Supply Current (Note 7) | | | | |
| Normal Operation (PD="H") | | | | |
| VA+VB | | 15 | 25 | mA |
| VD | | 6 | 9 | mA |
| Power-Down mode (PD="L") | | | | |
| VA+VB | | 20 | | uA |
| VD | | 10 | | uA |
| Power Consumption (Note 7) | | | | |
| Normal Operation | | 105 | 170 | mW |
| Power-Down mode | | 150 | | uW |
| Power Supply Rejection Ratio | | 50 | | dB |

Note 4: The ratio of the rms value of the signal to the sum of all other spectral components up to 20kHz except for the signal (included harmonic component, excluded DC component, analog input signal is -0.5dB). Inversed of THD+N.

Note 5: S/(N+D) with an input signal of 60dB below full-scale.

Note 6: When using only 20kHzLPF, S/N and DR are 99dB(typ.). When using CCIR-ARM filter, S/N is 99dB(typ.)

Note 7: Almost no current is supplied from VB pin.

DIGITAL FILTER CHARACTERISTICS

(Ta=25 °C ; VA,VD,VB=5.0V ± 10%; fs=48kHz)

| Low Pass Filter characteristics | | Symbol | min | typ | max | Units |
|--|---|--------|------|-------------------|------------------------|----------------|
| Passband | -0.005dB (Note 8) -0.02dB -0.06dB | PB | 0 | | 21.5 21.768 22.0 | kHz |
| Stopband | (Note 9) | SB | 26.5 | | | kHz |
| Passband Ripple | (Note 10) | PR | | | ± 0.005 | dB |
| Stopband Attenuation (Note 9, Note 11) | | SR | 80 | | | dB |
| Group Delay Distortion | | △ GD | | | 0 | us |
| Group Delay | (Note 12) | GD | | 29.3 | | 1/fs |
| High Pass Filter characteristics | | | | | | |
| Frequency Response | -3dB (Note 8) -0.5dB -0.1dB | FR | | 1.0 2.9 6.5 | | Hz Hz Hz |

Note 8: These frequencies scale with the sampling frequency(fs).

Note 9: Stopband is 26.5kHz to 3.0455MHz at fs=48kHz.

Note 10: Passband is DC to 21.5kHz at fs=48kHz.

Note 11: The analog modulator samples the input at 3.072MHz for a system sampling rate of fs=48kHz. There is no rejection of input signals at those bandwidths which are multiples of the sampling frequency (n x 3.072MHz ± 22kHz ; n=0,1,2,3...).

Note 12: The calculation delay time occurred by digital filtering. This is the time from the input of analog signal to setting the 20bit data of both channels to the output registers. GD=29.3/fs.

ELECTRICAL CHARACTERISTICS

■ Digital Characteristics

(Ta=25 °C ; VA,VD,VB=5.0V ± 10%)

Note 14: Refer to Serial Data Interface.

Note 15: Specified LRCK and FSYNC edges not to coincide with the rising edges of SCLK.

Note 16: The number of LRCK rising edges after PD brought high. The value is in master mode.

In slave mode it becomes one LRCK clock(1/fs) longer.

■ Timing Chart

OPERATION OVERVIEW

■ System clock

In slave mode, MCLK(256fs/384fs), LRCK(fs) and SCLK(64fs) are required for AK5351. Use a signal divided from the MCLK for LRCK. In master mode, only MCLK is needed. A LRCK clock rate meets standard audio rates (32kHz, 44.1kHz, 48kHz). In slave mode, the MCLK should be synchronized with LRCK but the phase is free of care.

The AK5351 includes the phase detect circuit for LRCK clock, the AK5351 is reset automatically when the synchronization is out of phase by changing the clock frequencies. (Please refer to the "Asynchronization - reset."). When changing sampling frequency(fs) after power-up, AK5351 should be reset.

During the operation (PD="H") following external clocks should never be stopped : CLK in master mode and MCLK, SCLK and LRCK in slave mode. When the clocks stop there is a possibility that the device comes into a malfunction because of over currents in the dynamic logic. If the external clocks are not present, the AK5351 should be in the power-down mode. (PD="L")

| fs | Master Clock (MCLK) | | SCLK(64fs) |
|---------|---------------------|------------|------------|
| | 256fs | 384fs | |
| 32.0kHz | 8.1920MHz | 12.2880MHz | 2.0480MHz |
| 44.1kHz | 11.2896MHz | 16.9344MHz | 2.8224MHz |
| 48.0kHz | 12.2880MHz | 18.4320MHz | 3.0720MHz |

Table 1. System Clock

■ Clock Circuit

| CMODE | MCLK |
|-------|-------|
| L | 256fs |
| H | 384fs |

AK5351 has an internal divider as shown in the above figure. The device can interface either or an external MCLK(256fs or 384fs) by controlling CMODE pin.

Serial Data Interface

Audio Serial Interface has four kinds of mode, it can be changed by SMODE1 and SMODE2 pins. Data format is MSB first, 2's complement.

| Figure | SMODE1 | SMODE2 | Mode | L/R polarity |
|----------|--------|--------|--|--------------|
| Figure 1 | L | L | Slave Mode: 20bit, MSB justified | Lch=H, Rch=L |
| Figure 2 | H | L | Master Mode: Similar to I ² S | Lch=H, Rch=L |
| Figure 3 | L | H | Slave Mode: I ² S | Lch=L, Rch=H |
| Figure 4 | H | H | Master Mode: I ² S | Lch=L, Rch=H |

Table 2. Serial Interface

1) SLAVE mode

An output channel is defined by LRCK. Both channel data are output in sequence, in order of the Lch first then Rch at the rate of fs. Data bits are clocked out via the SDATA pin at SCLK rate. Figure 1 and Figure 3 shows data output timing at SCLK=64fs. FSYNC enables SCLK to start clocking out data. The MSB is clocked out by the LRCK edge. SCLK causes the ADC to output succeeding bits when FSYNC is high. However, as I²S slave mode ignores FSYNC, it should hold "L" or "H".

2) MASTER mode

In MASTER mode, the A/D converter is driven from a master clock(MCLK:256fs/384fs) and outputs all other clocks(LRCK, SCLK). The falling edge of SCLK causes the ADC to output each bit. Figure 2 and Figure 4 shows the output timing. 2x fs clock of 50% duty is output via the FSYNC pin. FSYNC rises one SCLK cycle after the transition of LRCK edges and stays high during 16 serial clocks(16t_{SCLK}). Upper 16 bit data is output during FSYNC "H", lower 4 bit is output after FSYNC "L" transition.

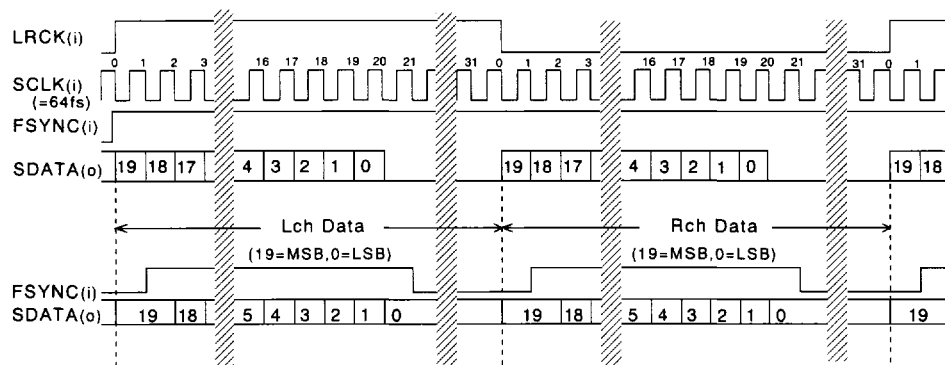

Figure 1. Data Output Timing (Slave mode)

Figure 2. Data Output Timing(Master mode)

Figure 3. Data Output Timing(I²S Slave mode)Figure 4. Data Output Timing (I²S Master mode)

■ Power-down mode

The AK5351 has to be reset once by bringing $\overline{\text{PD}}$ "L" upon power-up. All internal registers of the digital filter and so on in the AK5351 are reset by this operation. When exiting the power-down mode($\overline{\text{PD}}$ ="H"), the internal timing starts clocking by first MCLK "↑" (rising edge). In master mode internal counter starts at once, in slave mode internal counter starts after synchronizing with the first rising edge of LRCK. The serial output data is available after 516 counting clock of LRCK cycle.

■ Asynchronization-reset

In slave mode, if the phase difference between LRCK and internal control signals is larger than $+1/16 \sim -1/16$ of word period($1/f_s$), the synchronization of internal control signals with LRCK is done automatically at the first rising edge of LRCK.

■ High Pass Filter(HPFE pin)

The AK5351 has a Digital High Pass Filter(HPF) for DC-offset cancel. When HPFE pin goes "H", HPF is enabled. The cut-off frequency of the HPF is 1Hz(@ $f_s=48\text{kHz}$). It also scales with the sampling frequency(f_s). The HPF can be disabled by bringing HPFE pin "L". In this case, the AK5351 has the DC-offset of a few mV.

SYSTEM DESIGN

Figure 5 shows the system connection diagram. Figure 6 and Figure 7 shows the input buffer circuit. An evaluation board[AKD5351/2] is available which demonstrates the optimum layout, power supply arrangement and measurement results.

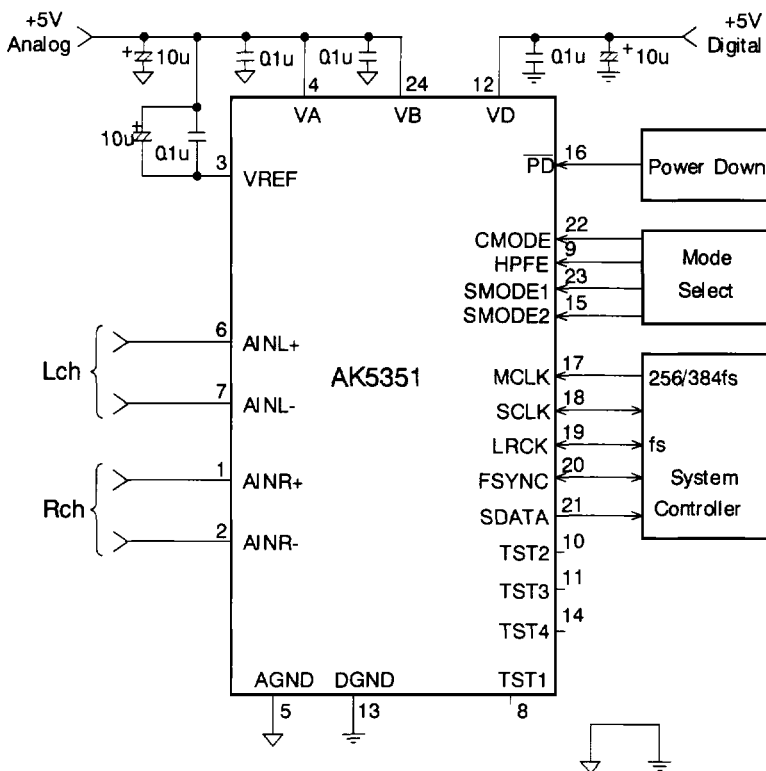

Figure 5. System Connection Diagram Example

NOTE: +5V Analog should be powered the same time or earlier than +5V Digital.

■ Grounding and Power Supply Decoupling

The AK5351 requires careful attention to power supply and grounding arrangements. The VA and VB are connected together through the chip substrate and have several ohm resistance. The power to VB should come up at the same time or faster than the power to VD, when they are fed separately to the device (Figure 5). As to the connections of decoupling capacitors, refer to Figure 5. The 0.1uF of decoupling capacitors connected power supply pins should be as near as possible to the power supply pin.

As AIN ± pins is near VD pin, ground pattern should be inserted between VD line and AINL ± lines to avoid digital noise coupling. Refer to evaluation board manual of AKD5352/1 Rev.B about board layout.

■ Analog connections

Analog signal is differentially input into the modulator via the AIN+ and the AIN- pins. The input voltage is the difference between AIN+ and AIN- pins. The full-scale of each pin is $\pm 2.10\text{Vp-p}$ on its reference voltage(VREF). In case that the positive input is more than its full-scale, the AK5351 outputs positive 7FFFFH(Hex, Full-scale). In case that the negative input is more than its full-scale, the AK5351 outputs negative 80000H(Hex, Full-scale). Analog inputs of the AK5351 are normally Full-differential inputs, while they are also acceptable Single-ended inputs. In case of Single-ended inputs, analog signal is input from either positive or negative input and the other side inputs bias voltage. Figure 7 is a circuit example which analog input signal is input 4.20Vp-p into AIN- pin and bias voltage into AIN+ pin. The DC offset is removed by the internal HPF.

AK5351 samples the analog inputs at 3.072MHz with $f_s=48\text{kHz}$. The digital filter rejects all noise between 26.5kHz and 3.0455MHz . However, the filter will not reject frequencies right around 3.072MHz (and multiples of 3.072MHz). Most audio signals do not have significant noise energy at 3.072MHz . Hence, a simple RC filter is sufficient to attenuate any noise energy at 3.072MHz .

The reference voltage for A/D converter is supplied from the VREF pin at VA reference. In order to eliminate the effects of high frequency noise on the VREF pin, a $10\mu\text{F}$ or less electrolytic capacitor and a $0.1\mu\text{F}$ ceramic capacitor should be connected parallel between the VREF and the VA pins. No current should be driven from the VREF pin.

The AK5351 accepts $+5\text{V}$ supply voltage. Any voltage which exceeds the upper limit of $(\text{VA}+)+0.3\text{V}$ and lower limit of $\text{AGND}-0.3\text{V}$ and any current beyond 10mA for the analog input pins(AINL \pm , AINR \pm) should be avoided. Excessive currents to the input pins may damage the device. Hence input pins must be protected from signals at or beyond these limits.

Use caution specially in case of using $\pm 15\text{V}$ in surrounding analog circuit.

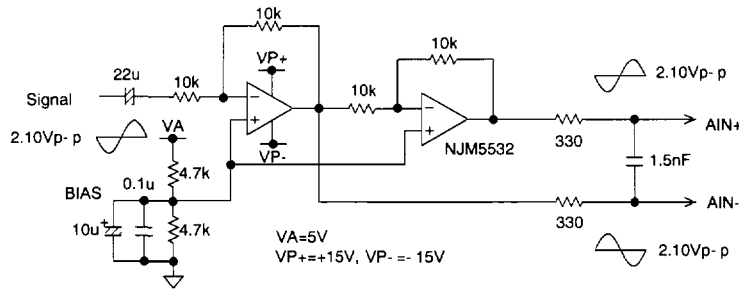

Figure 6. Full-differential Input Buffer Circuit Example

Figure 7. Single-ended Input Buffer Circuit Example

■ Digital Connections

To minimize digital originated noise, connect the ADC digital outputs only to CMOS inputs. Logic families of 4000B, 74HC, 74AC, 74ACT and 74HCT series are suitable.

■ Multiple AK5351

In systems where multiple ADC's are required, care must be taken to insure the internal clocks are synchronized between converters to make simultaneous sampling. In slave mode, synchronous sampling is achieved by supplying the same MCLK and LRCK to all converters. In master mode, the same PD signal is supplied to each ADC. The PD state is released at the first rising edge of MCLK after bringing PD into high. Hence, if the rising edge of PD and rising edge of MCLK coincides together the sampling difference among the ADC's modulator would occur. The difference could be $1/256$ fs in the sampling clock(64fs) of the modulator, typically 81ns at $f_s=48$ kHz.

PACKAGE

● 24pin VSOP (Unit: mm)

NOTE: Dimension " *" does not include mold flash.

0~10°

■ Material & Lead finish

Package: Epoxy
 Lead-frame: Copper
 Lead-finish: Soldering plate
