

Features

- High output current—1.2A
- Large output voltage swing— $\pm 12V$
- Low standby power—100 mW
- Wide full power bandwidth—20 kHz
- Low input bias current
- Low input offset voltage
- High open-loop gain > 100 dB
- MIL-STD-883 devices 100% manufactured in U.S.A.

General Description

The ELH0021 is a general purpose operational amplifier capable of delivering large output currents not usually associated with conventional IC op amps; the ELH0021 will provide output currents in excess of 1A at voltage levels of $\pm 12V$. In addition, both the inputs and outputs are protected against overload. The device is compensated with a single external capacitor and are free of any unusual oscillation or latch-up problems.

The excellent input characteristics and high output capability of the ELH0021 make it an ideal choice for power applications such as DC servos, capstan drivers, deflection yoke drivers, and programmable power supplies.

Other applications include torque drivers for inertial guidance systems, diddle yoke drivers for alphanumeric CRT displays, cable drivers, and programmable power supplies for automatic test equipment.

The ELH0021 is supplied in an 8-pin TO-3 package rated at 20W with suitable heatsink. The ELH0021 is guaranteed over the temperature range of -55°C to +125°C.

Elantec facilities comply with MIL-I-45208A and other applicable quality specifications. Elantec's Military devices are 100% fabricated and assembled in our rigidly controlled, ultra-clean facilities in Milpitas, California. Important Note:

All parameters having Min/Max specifications are guaranteed. The Test Level column indicates the specific device testing actually performed during production and Quality inspection. Elantec performs most electrical tests using modern high-speed automatic test equipment, specifically the LTX77 Series system. Unless otherwise noted, all tests are pulsed tests, therefore $T_J = T_C = T_A$.

Note 1: Rating applies for supply voltages above $\pm 15V$. For supplies less than $\pm 15V$, rating is equal to supply voltage.

Note 2: Rating applies for ELH0021K with $R_{SC} = 0\Omega$.

Note 3: Rating applies as long as package power rating is not exceeded.

Note 4: Specifications apply for $\pm 5V \leq V_S \leq \pm 18V$.

Note 5: The ELH0021, like all Class B amplifiers, has a "dead band" when V_{OUT} is near 0V. Typical values for the "dead band" are in the 50 μV to 200 μV range. Open-loop gain is measured at V_{OUT} from $\pm 0.5 V_{DC}$ TO $\pm 10.0 V_{DC}$ which is out of the range of the "dead band".
