Digital color sensor

S11059-02DT/-03DS

I^{2}C interface-compatible color sensor

The S11059-02DT/-03DS is a digital color sensor that supports the I^{2}C (inter-integrated circuit) interface. It is sensitive to red (λ=615 nm), green (λ=530 nm), blue (λ=460 nm), and infrared (λ=855 nm) light, and outputs detected results as 16-bit digital data for each color. The photodiode for each color is automatically switched sequentially to perform measurements. The sensitivity and integration time can be adjusted so that light measurements can be performed over a wide range.

Features

- I^{2}C interface compatible
- Sequential measurements of red, green, blue, and infrared light
- 2-step sensitivity switching (sensitivity ratio 1 : 10)
- Sensitivity adjustment by setting the integration time
- Low voltage (2.5 V or 3.3 V) operation
- Low current consumption: 75 µA typ.
- With internal infrared-cut filter
- Wide dynamic range (Low gain: 1 to 10 klx)

Applications

- LCD backlight adjustment for cell phones, notebook PC, etc.
- Energy-saving sensor for large-size TV, etc.
- Various types of light detection or color adjustment

Absolute maximum ratings

Parameter	Symbol	Condition	Value	Unit
Supply voltage	Vdd	Ta=25 °C	-0.3 to +6	V
Output current	Io	Ta=25 °C	±10	mA
Power dissipation	P	Ta=25 °C	300	mW
Operating temperature	Topr	No condensation	-25 to +80	°C
Storage temperature	Tstg	No condensation	-40 to +85	°C
Reflow soldering conditions*^{1}	Tsol		Peak temperature 240 °C max., 1 time (see page 10)	-

*1: Moisture absorption and reflow conditions: JEDEC J-STD-020D LEVEL5a
Note: Exceeding the absolute maximum ratings even momentarily may cause a drop in product quality. Always be sure to use the product within the absolute maximum ratings.

Recommended operating conditions

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Supply voltage	Vdd		2.25	-	3.63	V
I^{2}C bus pull-up voltage*^{2}	Vbus	Rp=2.2 kΩ	2.25	-	3.63	V
Bus capacitance (SDA, SCL)	Cbus		-	-	400	pF

*2: Pull-up resistor value is determined by Cbus and Vbus.
Note: Always use this product with Vdd=Vbus. Normal operation is not guaranteed unless Vdd is equal to Vbus.

Electrical and optical characteristics

08		Output data (blue, LSB)							
09	Sensor data register (infrared)	Output data (infrared, MSB)							
0A		Output data (infrared, LSB)							

Adrs 00 bit 7: Asserting this bit to "1", the ADC block is reset. The register data is not reset. To start the operation, set this bit to "0".

Adrs 00 bit 6: Asserting this bit to "1" the device goes into standby mode. The ADC block stops its operation. The register data is not reset. To start the operation, set this bit to "0".

Adrs 00 bit 5: This monitors auto standby function. "1" means standby mode. This is read only.

Adrs 00 bit 3: Gain selection bit. "1" is high gain mode and "0" is low gain mode. This bit is selecting the photodiode area. The size ratio of high gain photodiode area and low gain photodiode area is 10 : 1. Therefore the gain ratio is 10 times from low to high.

Adrs 00 bit 2: Asserting this bit to "1", the device goes into manual setting mode. Deasserting this bit to 0, goes into fixed period mode. In manual setting mode, the S11059-02DT automatically goes to standby mode after a measurement is made. In fixed period mode, measurements are continuously repeated.

Adrs 00 bit 1,0: These bits select the period of internal basis clock. The period is equal to integration time per color in fixed period mode. "00" is 87.5 us, "01" is 1.4 ms, "10" is 22.4 ms, "11" is 179.2 ms. In manual setting mode, "00" is 175 µs, "01" is 2.8 ms, "10" is 44.8 ms, "11" is 368 ms. The integration time per color is set to multiple value (Adrs 01 & 02) with the period.

Adrs 01 & 02: This is a multiple value setting in manual setting mode, and can be set to a minimum of 0x0000 and a maximum of 0xFFFF (65535). This is used to set how far to expand the integration time per color which specified by "Integration time setting" (Tint). For example, if you want to set the integration time per color to 546 ms, set 175 µs by Tint="00" and then set this register to N=3120 (0xC30).

Mode	Manual timing register (Adrs 01 & 02)	Integration time setting (Tint)			
		00	01	10	11
Fixed period mode	Disabled	87.5 µs	1.4 ms	22.4 ms	179.2 ms
Manual setting mode	N	175 × N µs	2.8 × N ms	44.8 × N ms	358.4 × N ms

Adrs 03 to 0A: These bytes are register for sensor data. S11059-02DT measurement result is stored in these registers when the I^2C command is changed to read mode. The values are kept until next read cycle.

Initial setting [Low gain, manual setting mode, Tint=00 (175 µs), integartion time 546 ms/ch]

Adrs	Function	bit								Hex
		7	6	5	4	3	2	1	0

Compensation method for sensitivity variation

1. Power on

2. Power on reset, initialization

3. ADC reset enable, standby disable

4. Measurement condition setting
Gain, manual setting mode, integration time

5. ADC reset disable

6. Measurement start (integration time)

No — Standby monitor = "1"?

Yes

7. Measurement end (integration time)

8. Data read out

9. Compensation

Sensitivity variation can be decreased using the compensation coefficient which is calculated from the integration time measurement result. Explanation of compensation method is shown as follows.

■ Integration time measurement method

In case of integration time measurement, it is necessary to set manual setting mode. The integration time measurement starts after "ADC reset" disabled. To measure the finishing integration time (measurement) Tmeas, check "Standby monitor" bit until it becomes to "1".

■ Compensation method

The sensitivity compensation that used integration time is as follows:

$$K = \frac{Tset}{Tmeas}$$

$$S' = S \cdot K$$

K : compensation coefficient
Tset : integration time (setting)
Tmeas: integration time (measurement)
S : photo sensitivity (measurement)
S' : photo sensitivity (compensation)

■ Measurement accuracy of integration time

The measurement minimum resolution of Tmeas is defined by the looping duration (Tunit). In case of default setting, the Tset is 2184 ms and assuming the Tunit to 7.8 ms, the accuracy of integration time is calculated by following formula.

$$\frac{Tunit}{Tset} \times 100 = \frac{7.8}{2184} \times 100 = 0.36\%$$

The specification of compensated sensitivity is defined as 0.36% accuracy.
