JAN JFET-INPUT OPERATIONAL AMPLIFIERS

Precision Monolithics Inc

GENERAL DESCRIPTION

This data sheet covers the electrical requirements for a monolithic, low-power, internally-compensated JFET-input operational amplifier as specified in MIL-M-38510/114 for device types 01 to 06. Devices supplied to this data sheet are manufactured and tested at PMI's MIL-M-38510 certified facility and are listed in QPL-38510.

Complete device requirements will be found in MIL-M-38510 and MIL-M-38510/114 for Class B and Class S processed devices.

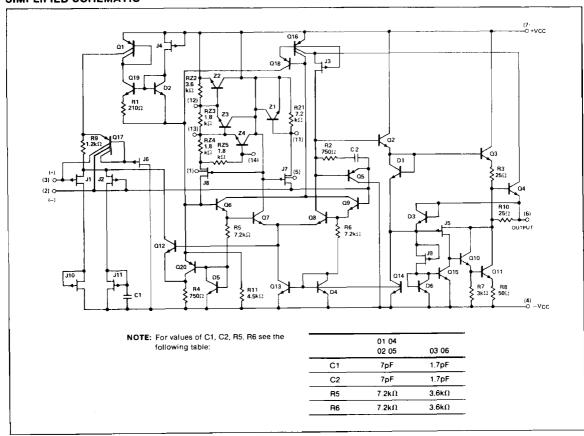

GENERIC CROSS-REFERENCE INFORMATION

This cross-reference information is presented for the convience of the user. The generic-industry types listed may not have iden-

tical operational performance characteristics across the military temperature range or reliability factors equivalent to the MIL-M-38510 device.

Military Device Type	Generic-Industry Type
01	LF-155
04	LF-155A
02	LF-156
05	LF-156A
03	LF-157
06	LF-157A

SIMPLIFIED SCHEMATIC

ABSOLUTE MAXIMUM RATINGS

Supply Voltage Range	±22V
Input Voltage Range (Note 1)	±20V
Differential Input Voltage Range	±40V
Lead Temperature (Soldering, 60 sec)	
Junction Temperature	lote 3)
Storage Temperature Range ´-65° C to +	150°C
Output Short-Circuit Duration Unlimited (N	lote 2)

NOTES:

- Short circuit may be to ground to either supply. Rating applies to + 125°C
 case temperature or +75°C ambient temperature.
- 3. For short-term test (in the specific burn-in and life test configuration when required and up to 168 hours maximum), $T_j = 275^{\circ}C$.

RECOMMENDED OPERATING CONDITIONS

Supply Voltage Range	±5 to ±20 VDC
Ambient Temperature Range	55°C to +125°C

ELECTRICAL CHARACTERISTICS at V_{CC} from $\pm 5V$ to $\pm 20V$; source resistance = .50 ohm; ambient temperature range = -55° C to $+125^{\circ}$ C and figure 1, unless otherwise noted.

NOTES:

CASE OUTLINE

- 1. Bias currents are actually junction leakage currents which double (approximately) for each 10°C increase in junction temperature T_j. Measurement of bias current is specified at T_j rather than T_A, since normal warm-up thermal transients will affect the bias currents. The measurements for bias currents must be made within 25ms or 5 loop time constants after power is first applied to the device for test. Measurement at T_A = -55° C is not necessary since expected values are too small for typical test systems.
- Bias current is sensitive to power supply voltage, common-mode voltage and temperature as shown by the following typical curves:

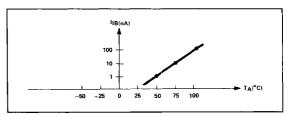

PIN CONNECTIONS

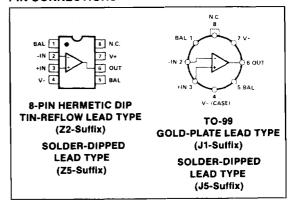

POWER AND THERMAL CHARACTERISTICS

Package	Case outline		Maximum θJ—C	Maximum θJA
8 Lead Can (TO-99)	G	330mW at T _A = 125°C	40°C/W	150° C/W
8 Lead Hermetic DIF	P	417mW at T _A = 125°C	50°C/W	120°C/W

- Negative I_{IB} minimum limits reflect the characteristics of device with bias current compensation.
- 4. CMR is calculated from V_{IO} measurements at $V_{CM} = +15V$ and -15V.
- Continuous limits shall be considerably lower. Protection for shorts to either supply exists providing that T_i(max) ≤ 175°C.
- Because of thermal feedback effects from output to input, open-loop gain is not guaranteed to be linear or positive over the operating range. These requirements, if needed, should be specified by the user in additional procurement documents.

ELECTRICAL CHARACTERISTICS at V_{CC} from $\pm 5V$ to $\pm 20V$; source resistance = 50 ohm; ambient temperature range = -55° C to $+125^{\circ}$ C and figure 1, unless otherwise noted.

Noise (Referred to Input) Broadband	N _J (BB)	$\pm V_{CC} = \pm 20V$, $T_A = 25^{\circ} C$ Bandwidth = 5kHz		10		10	μV _{rms}	
Noise (Referred to Input) Popcorn	N _I (PC)	$\pm V_{CC} = \pm 20V$, $T_A = 25^{\circ}C$ Bandwidth = 5kHz	_	40		40	μV _{pk}	

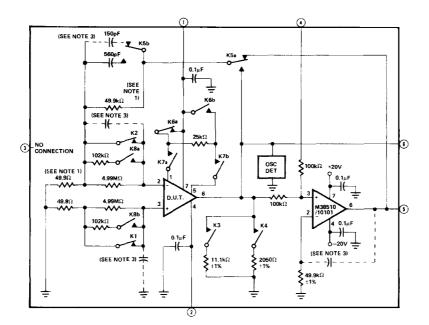

NOTES:

- 1. Bias currents are actually junction leakage currents which double (approximately) for each 10°C increase in junction temperature T_j. Measurement of bias current is specified at T_j rather than T_A, since normal warm-up thermal transients will affect the bias currents. The measurements for bias currents must be made within 25ms or 5 loop time constants after power is first applied to the device for test. Measurement at T_A = -55°C is not necessary since expected values are too small for typical test systems.
- Bias current is sensitive to power supply voltage, common-mode voltage and temperature as shown by the following typical curves:

- Negative I_{IB} minimum limits reflect the characteristics of device with bias current compensation.
- 4. CMR is calculated from V_{IO} measurements at V_{CM} = +15V and -15V.
- Continuous limits shall be considerably lower. Protection for shorts to either supply exists providing that T_i(max) ≤ 175° C.
- Because of thermal feedback effects from output to input, open-loop gain is not guaranteed to be linear or positive over the operating range. These requirements, if needed, should be specified by the user in additional procurement documents.

NOTES:

PMD

- 1. All resistors are $\pm 0.1\%$ tolerance and all capacitors are $\pm 10\%$ tolerance, unless otherwise specified.
- Precautions shall be taken to prevent damage to the D.U.T. during insertion into socket and change of state of relays (i.e. disable voltage supplies, current limit ±V_{CC}, etc.).
- 3. Compensation capacitors should be added as required for test circuit stability. Two general methods for stability compensation exist. One method is with a capacitor for nulling amp feedback. The other method is with a capacitor in parallel with the 49.9kfl closed-loop feedback resistor. Both methods should not be used simultaneously. Proper wiring procedures shall be followed to prevent unwanted coupling and oscillations, etc. Loop response and
- settling time shall be consistent with the test rate such that any value has settled for at least five loop time constants before the value is measured.
- Adequate settling time should be allowed such that each parameter has settled to within 5% of its final value.
- 5. All relays are shown in the normal de-energized state.
- The nulling amplifier shall be a M38510/10101XXX. Saturation of the nulling amplifier is not allowed on tests where the E (Pin 5) value is measured.
- The load resistors 2050Ω and 11.1kΩ yield effective load resistances of 2kΩ and 10kΩ respectively.
- Any oscillation greater than 300mV in amplitude (peak-to-peak) shall be cause for device failure.

BURN-IN

Devices supplied by PMI have been subjected to burn-in per Method 1015 of MIL-STD-883 using test condition C with circuit shown on Figure 4 or test condition F using circuit shown on Figure 5.
