LV5235V — 18-channel LED Driver

Overview

The LV5235V is a 18-channel LED driver IC that is capable of switching between constant-current output and open drain output. It enables 3-wire serial bus control (address designation)/I^{2}C serial bus control to be set arbitrarily using an external pin. Also possible are 18-channel LED ON/OFF control and the setting of the PWM luminance in 256 steps. The device also has a built-in fade-in/fade-out function. Up to 32 driver ICs can be connected using the slave address setting pins.

Features

- 18-channel output constant-current LED driver/open drain output LED driver (selected by using an external pin)
    - Supports separate ON/OFF setting for each LED output, high withstand voltage (VOUT<42V)
        - In the constant-current mode (OUTSCT: L), the reference current is set by the value of resistor connected to the external pin (RT1).
            - Built-in D/A (5 bits) for switching current level … 0.96mA to 30.7mA (RGB drive)
            - Constant current (I$_O$ max=50mA) for full-color LEDs × 18 channels
        - In the open drain mode (OUTSCT: M), high current drive (I$_O$ max=100mA) × 18 channels
        - In the constant-current mode (OUTSCT: H)
            - Only RGB6 is open drain (I$_O$ max=100mA)
- Luminance adjustment using internal PWM control (256 steps)
    - 8-bit PWM luminance dimming (0% to 99.6%)
    - 6-phase PWM
- Fade-in/fade-out function (PWM control priority), supporting synchronous connection
    - Supports separate fade ON/OFF for each LED output (fade time common for all channels)
    - Interrupt control possible for fade function
- Selection of 3-wire/I^{2}C serial bus control signals enabled (switching using an external pin)
    - Slave addressing (5 bits, connection of up to 32 driver ICs possible)
- Low current consumption
- Output malfunction protection circuits (thermal protection function, UVLO detection protection function)

LV5235V

Specifications

Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V_{CC} max		6	V
Output voltage	V_O max	LED off	42	V
Output current	I_O max		100	mA
Allowable power dissipation	Pd max	Ta ≤ 25°C *	1.36	W
Operating temperature	Topr		-25 to +75	°C
Storage temperature	Tstg		-40 to +125	°C

* Specified board : 114.3mm × 76.1mm × 1.6mm, glass epoxy board. Exposed Die-pad area is not a substrate mounting.

[Warning]: If you should intend to use this IC continuously under high temperature, high current, high voltage, or drastic temperature change, even if it is used within the range of absolute maximum ratings or operating conditions, there is a possibility of decrease reliability. Please contact us for a confirmation.

Operating Conditions at Ta = 25°C

LV5235V

Pin No.	Pin Name	Pin function	Equivalent Circuit
38	SGND	GND pin	

39	TEST	Test pin
		  This pin must always be connected to
		  GND.	

40	RESET	Reset signal input pin Reset status when set to low.	
41	RT1	Reference current setting resistor connection pin. By connecting the external register between this pin and GND, the reference current is generated. The pin voltage is approximately 0.98V. By changing the current level, it is possible to change the oscillator frequency and LED driver current value (in the constant-current mode).	
42	CT	Oscillator frequency setting capacitor connection pin/oscillator input pin. By changing the value of capacitance, it is possible to change the oscillator frequency. The capacitor must be connected to this pin of the master-side IC. The CT pin of the slave-side IC must be connected as the oscillator input pin.	
43	OUTSCT	LED driver output type setting pin When set to low: Constant-current output is set for the LED driver. When set to middle: Open drain output is set for the LED driver. When set to high: Constant-current output is set for the LED driver. However, open drain output is set for the only LED6 driver.	
44	OSC_OUT	Oscillator output pin When a multiple number of driver ICs are connected for use, the oscillators can be connected in synchronization by connecting the OSC_OUT output to the CT pin of the ICs to be connected.	

Continued from preceding page.

Application Circuit Diagrams

● Specifications when one driver IC is used
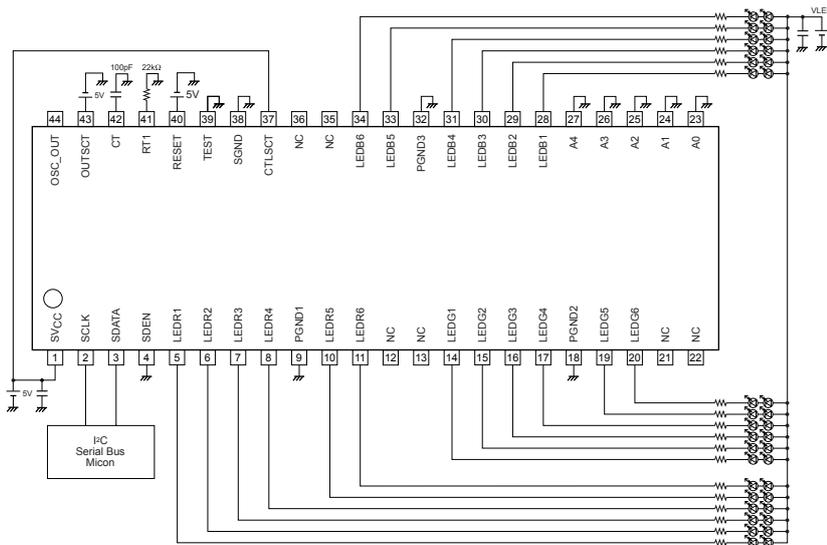

Use as a master-side IC
Slave selection: A0-A4: low
Address setting: Master (100-0000)
Nothing must be connected to the NC pins

● Specifications when more than one driver IC is used
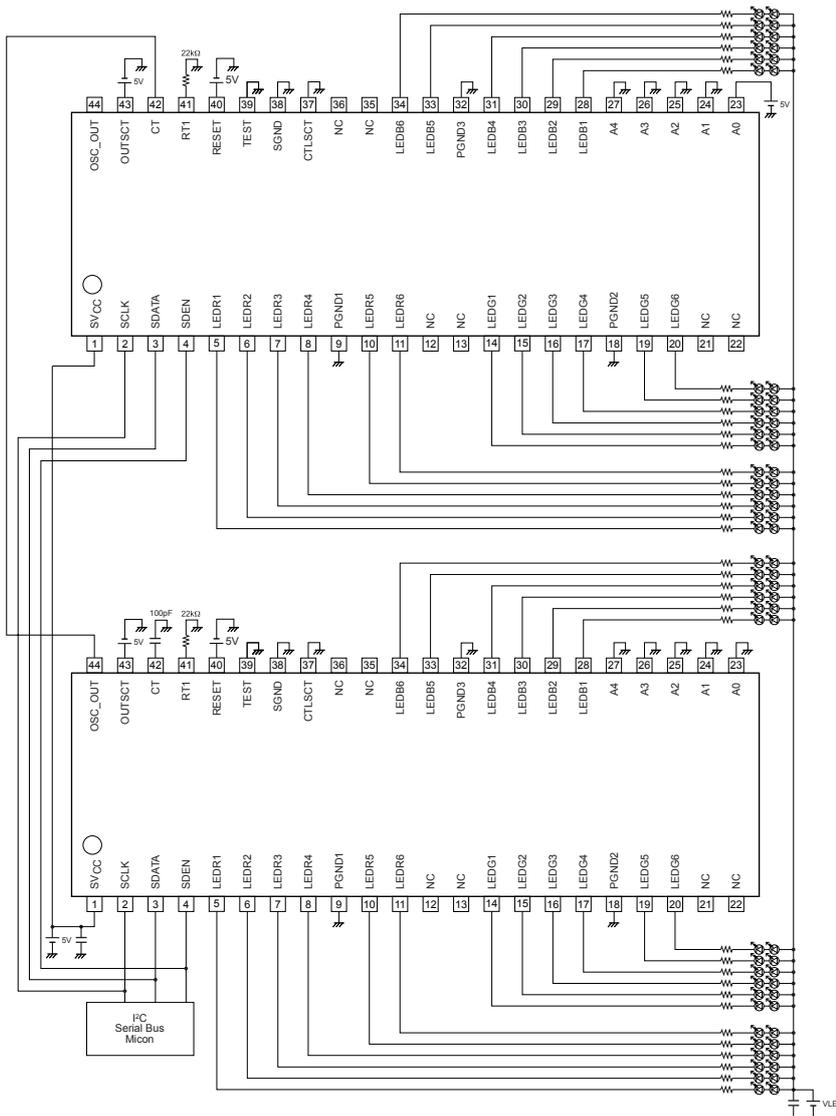

Use as a slave-side IC
Slave selection: A0 high: A1-A4 low
Address setting: Slave (100-0001)

Use as a master-side IC
Slave selection: A0-A4: low
Address setting: Master (100-0000)
Nothing must be connected to the NC pins

The oscillator frequency is determined by the master IC.
The synchronous connection of the oscillator can be established by connecting the oscillator output (OSC_OUT) to the CT pins of the slave-side ICs.
Nothing must be connected to the NC pins.

Serial Bus Communication Specifications

1) 3-wire serial bus transfer timing conditions
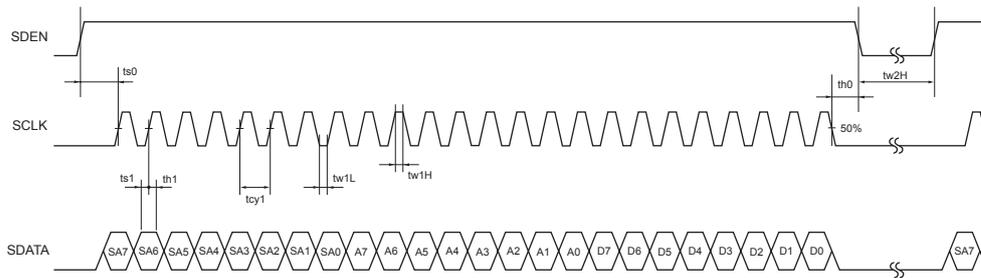

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Cycle time	tcy1	SCLK clock period	200	-	-	ns
Data setup time	ts0	SDEN setup time relative to the rise of SCLK	90	-	-	ns
	ts1	SDATA setup time relative to the rise of SCLK	60	-	-	ns
Data hold time	th0	SDEN hold time relative to the fall of SCLK	200	-	-	ns
	th1	SDATA hold time relative to the fall of SCLK	60	-	-	ns
Pulse width	tw1L	Low period pulse width of SCLK	90	-	-	ns
	tw1H	High period pulse width of SCLK	90	-	-	ns
	tw2L	Low period pulse width of SDEN	1	-	-	μs

Data length: 24 bits

Clock frequency: 5 MHz or less

When 24 SCLK clock signals have been input during the high period of SDEN, the SDATA is taken in at the rising edge of SCLK.

Note: If the number of SCLK clock signals during the high period of SDEN is 23 or less, SDATA is not taken in. If it is 25 or more, the register address is automatically incremented every time 1 byte is taken in.

The slave address is assigned by the first byte, and the register address on the serial map is specified by the next byte. The third byte transfers the data to the address specified by the register address that was written by the second byte and if the data subsequently continues even after this, the register address is automatically incremented for the fourth and subsequent bytes. As a result, it is possible to send the data continuously from the specified addresses. Data of less than one byte is ignored. However, when the address reaches 2ch, the next byte to be transferred becomes 00h.

Example of a write operation:
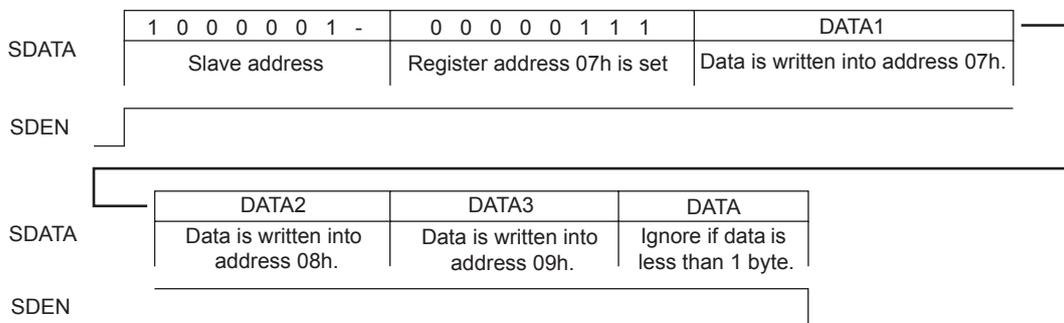

2) I²C serial transfer timing conditions
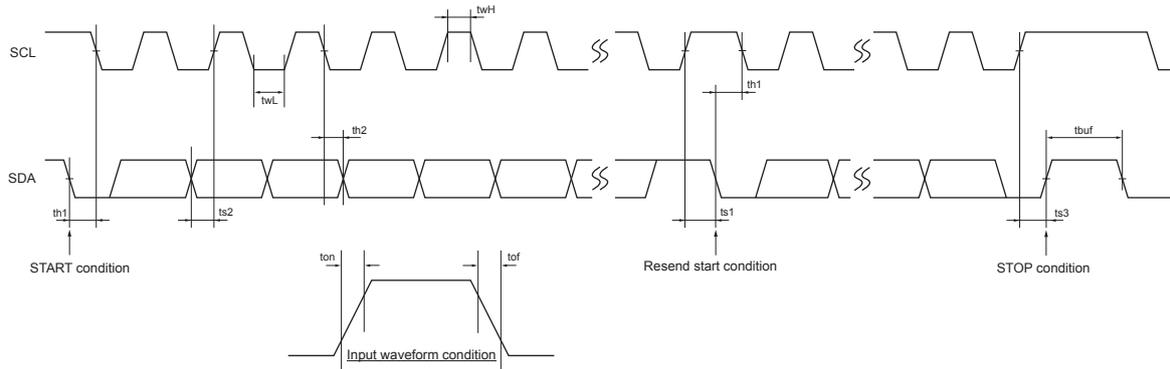

Standard mode

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
SCL clock frequency	fsc1	SCL clock frequency	0	-	100	kHz

	ts2	SDA setup time relative to the rise of SCL	250	-	-	ns
	ts3	SCL setup time relative to the rise of SDA	4.0	-	-	μs
Data hold time	th1	SCL hold time relative to the fall of SDA	4.0	-	-	μs
	th2	SDA hold time relative to the fall of SCL	0	-	-	μs
Pulse width	twL	SCL pulse width for the L period	4.7	-	-	μs
	twH	SCL pulse width for the H period	4.0	-	-	μs
Input waveform conditions	ton	SCL and SDA (input) rise time	-	-	1000	ns
	tof	SCL and SDA (input) fall time	-	-	300	ns
Bus free time	tbuf	Time between STOP condition and START condition	4.7	-	-	μs

High-speed mode

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
SCL clock frequency	fsc1	SCL clock frequency	0	-	400	kHz
Data setup time	ts1	SCL setup time relative to the fall of SDA	0.6	-	-	μs
	ts2	SDA setup time relative to the rise of SCL	100	-	-	ns
	ts3	SCL setup time relative to the rise of SDA	0.6	-	-	μs
Data hold time	th1	SCL hold time relative to the fall of SDA	0.6	-	-	μs
	th2	SDA hold time relative to the fall of SCL	0	-	-	μs
Pulse width	twL	SCL pulse width for the L period	1.3	-	-	μs
	twH	SCL pulse width for the H period	0.6	-	-	μs
Input waveform conditions	ton	SCL and SDA (input) rise time	-	-	300	ns
	tof	SCL and SDA (input) fall time	-	-	300	ns
Bus free time	tbuf	Time between STOP and START conditions	1.3	-	-	μs

I²C bus transfer method

Start and stop conditions

During data transfer operation using the I²C bus, SDA must basically be kept in constant state while SCL is "H" as shown below.
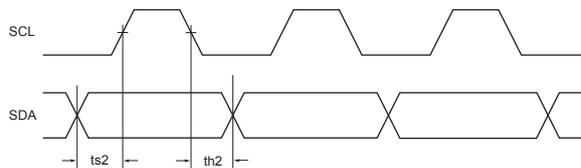

When data is not being transferred, both SCL and SDA are set in the "H" state.

When SCL=SDA is "H," the start condition is established when SDA is changed from "H" to "L," and access is started.

When SCL is "H," the stop condition is established when SDA is changed from "L" to "H," and access is ended.
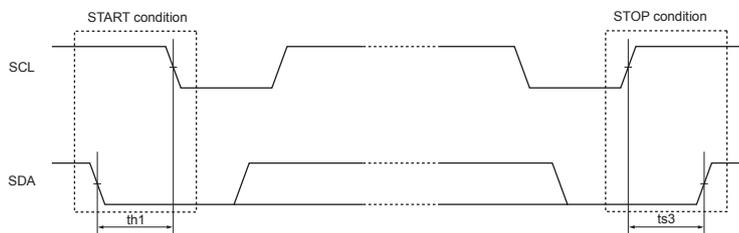

Data transfer and acknowledgement response

After the start condition has been established, the data is transferred one byte (8 bits) at a time.

Any number of bytes of data can be transferred continuously.

Each time the 8-bit data is transferred, the ACK signal is sent from the receive side to the send side. The ACK signal is issued when SDA on the send side is released and SDA on the receive side is set to "L" immediately after fall of the clock pulse at the SCL eighth bit of data transfer to "L."

When the next 1-byte transfer is left in the receive state after sending the ACK signal from the receive side, the receive side releases SDA at the fall of the SCL ninth clock.

In the I²C bus, there is no CE signal. In its place, a 7-bit slave address is assigned to each device, and the first byte of transfer is assigned to the command (R/W) representing the 7-bit address and subsequent transfer direction. Note that only write is valid in this IC. The 7-bit address is transferred sequentially starting with MSB, and the eighth bit is set to "L" which indicates a write.
