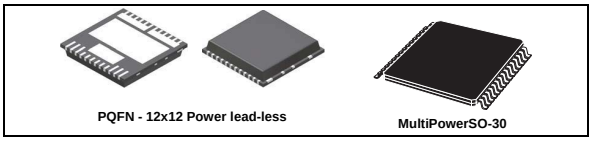
Double 4mΩ high-side driver with analog current sense for automotive applications

Datasheet - production data



Features

Max transient supply voltage	V_{CC}	41 V
Operating voltage range	V_{CC}	4.5 to 28 V
Max on-state resistance (per ch.)	R_{ON}	4 mΩ
Current limitation (typ)	I_{LIMH}	90 A
Off-state supply current	I_S	2 µA(1)

1. Typical value with all loads connected

- General
  - Very low standby current
  - 3.0 V CMOS compatible inputs
  - Optimized electromagnetic emissions
  - Very low electromagnetic susceptibility
  - Compliant with European directive 2002/95/EC
  - Very low current sense leakage
- Diagnostic functions
  - Proportional load current sense
  - High current sense precision for wide currents range
  - Diagnostic enable pin
  - Off-state open-load detection
  - Output short to V_{CC} detection
  - Overload and short to ground (power limitation) indication
  - Thermal shutdown indication
- Protection
  - Undervoltage shutdown
  - Overvoltage clamp
  - Load current limitation
  - Self limiting of fast thermal transients
  - Protection against loss of ground and loss of V_{CC}
  - Overtemperature shutdown with auto restart (thermal shutdown)
  - Inrush current active management by power limitation
  - Reverse battery protection with self switch on of the Power MOSFET
  - Electrostatic discharge protection

Applications

- All types of resistive, inductive and capacitive loads
- Suitable for power management applications

Description

The VND5E004A-E and VND5E004ASP30-E are double channel high-side drivers manufactured using ST proprietary VIPower® M0-5 technology and housed in PQFN-12x12 power lead-less and MultiPowerSO-30 packages. The devices are designed to drive 12 V automotive grounded loads, and to provide protection and diagnostics. They also implement a 3 V and 5 V CMOS-compatible interface for use with any microcontroller.

The devices integrate advanced protective functions such as load current limitation, inrush and overload active management by power limitation, overtemperature shut-off with auto-restart and overvoltage active clamp. A dedicated analog current sense pin is associated with every output channel providing enhanced diagnostic functions including fast detection of overload and short-circuit to ground through power limitation indication, overtemperature indication, short-circuit to V_{CC} diagnosis and on-state and off-state open-load detection. The current sensing and diagnostic feedback of the whole device can be disabled by pulling the DE pin low to share the external sense resistor with similar devices.

2.1 Absolute maximum ratings

Applying stress which exceeds above the ratings listed in *Table 3: Absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to the conditions in this section for extended periods may affect device reliability.

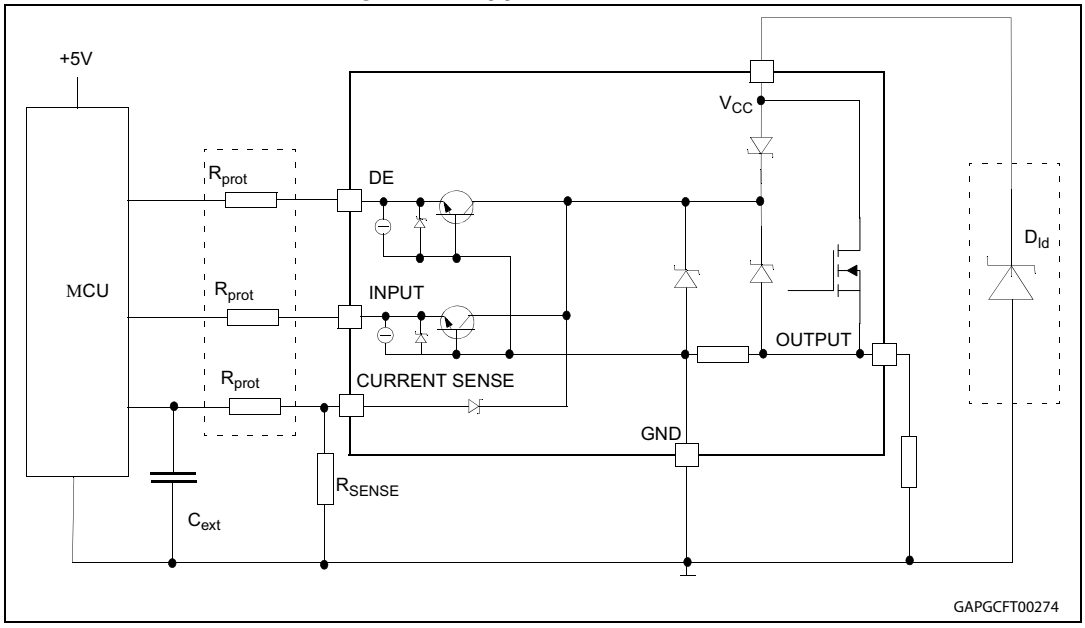
3 Application information

Figure 32. Application schematic



3.1 MCU I/Os protection

When negative transients are present on the V_{CC} line, the control pins are pulled negative to approximately -1.5V.

ST suggests the insertion of resistors (R_{prot}) in the lines to prevent the microcontroller I/O pins from latching up.

The values of these resistors provide a compromise between the leakage current of the microcontroller, the current required by the HSD I/Os (input levels compatibility) and the latch-up limit of the microcontroller I/Os.

$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C}-V_{IH}) / I_{IHmax}$

Calculation example:

For V_{CCpeak}= - 1.5V and $I_{latchup} \geq$ 20mA; $V_{OH\mu C} \geq$ 4.5V

$75\Omega \leq R_{prot} \leq 240k\Omega$.

Recommended values: R_{prot} =10kΩ, C_{EXT}=10nF

3.2 Load dump protection

D_{ld} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds the V_{CCPK} maximum rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO 7637-2: 2004(E) table.

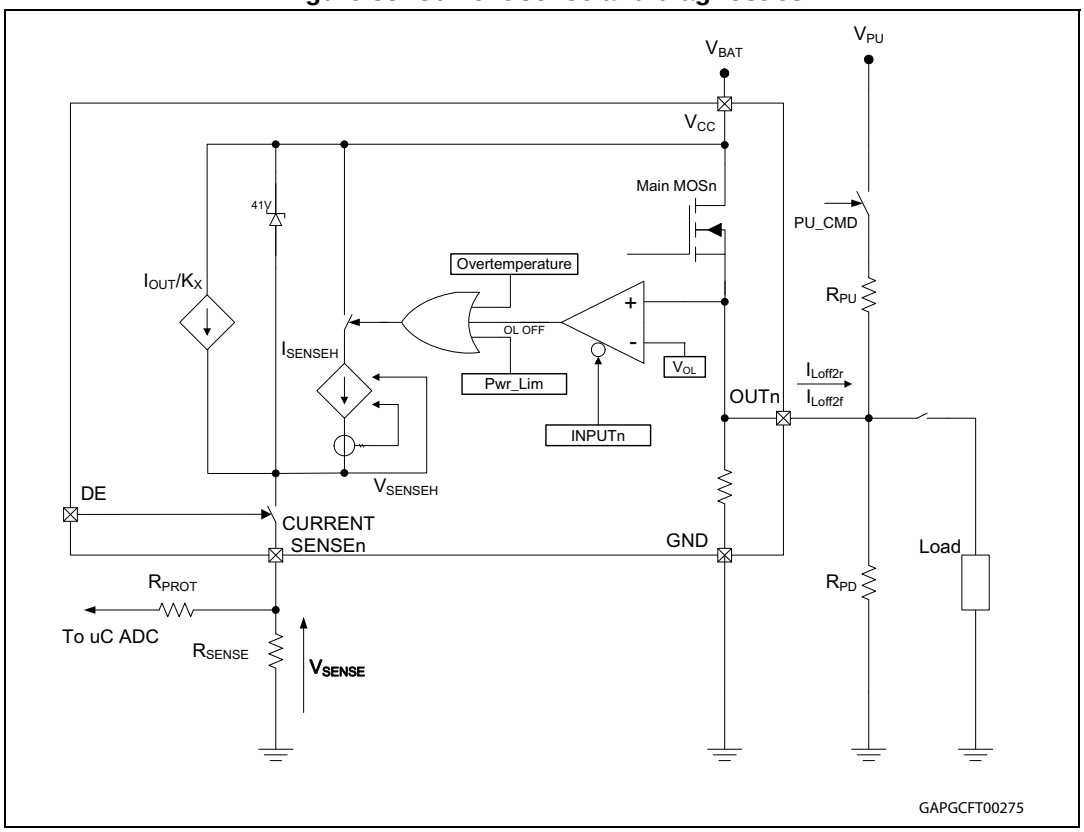
3.3 Current sense and diagnostic

The current sense pin performs a double function (see *Figure 33: Current sense and diagnostics*):

- **Current mirror of the load current in normal operation,** delivering a current proportional to the load current according to a known ratio $\mathbf{K_X}$.
  The current I_{SENSE} can be easily converted to a voltage V_{SENSE} by means of an external resistor R_{SENSE}. Linearity between I_{OUT} and V_{SENSE} is ensured up to 5V minimum (see parameter V_{SENSE} in *Table 9: Current sense (8 V < VCC < 18 V)*). The current sense accuracy depends on the output current (refer to current sense electrical characteristics *Table 9: Current sense (8 V < VCC < 18 V)*).
- **Diagnostic flag in fault conditions**, delivering a fixed voltage V_{SENSEH} up to a maximum current I_{SENSEH} in case of the following fault conditions (refer to *Table 11: Truth table*):
  - Power limitation activation
  - Overtemperature
  - Short to V_{CC} in off-state
  - Open-load in off-state with additional external components.

A logic level low on the DE pin simultaneously sets all the current sense pins of the device in a high impedance state, thus disabling the current monitoring and diagnostic detection. This feature allows multiplexing of the microcontroller analog inputs by sharing the sense resistance and ADC line among different devices.

Figure 33. Current sense and diagnostics



3.3.1 Short to V_{CC} and off-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Little or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

Off-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor (R_{PU}) connecting the output to a positive supply voltage (V_{PU}).

It is preferable that V_{PU} be switched off during the module standby mode to avoid an increase in the overall standby current consumption in normal conditions, that is, when the load is connected.

An external pull down resistor (R_{PD}) connected between output and GND is mandatory to avoid misdetection in case of floating outputs in off-state (see *Figure 33: Current sense and diagnostics*).

R_{PD} must be selected in order to ensure $V_{OUT} < V_{OLmin}$ unless pulled up by the external circuitry:

$$V_{OUT}\big|_{Pull\text{-}up\_OFF} = R_{PD} \cdot I_{L(off2)f} < V_{OLmin} = 2V$$

$R_{PD} \leq 22\ K\Omega$ is recommended.

For proper open-load detection in off-state, the external pull-up resistor must be selected according to the following formula:

$$V_{OUT}\big|_{Pull\text{-}up\_ON} = \frac{R_{PD} \cdot V_{PU} - R_{PU} \cdot R_{PD} \cdot I_{L(off2)r}}{R_{PU} + R_{PD}} = V_{OLmax} = 4V$$

For the values of V_{OLmin},V_{OLmax}, $I_{L(off2)r}$ and $I_{L(off2)f}$ see *Table 10: Open-load detection (8 V < VCC < 18 V; VDE = 5 V)*.

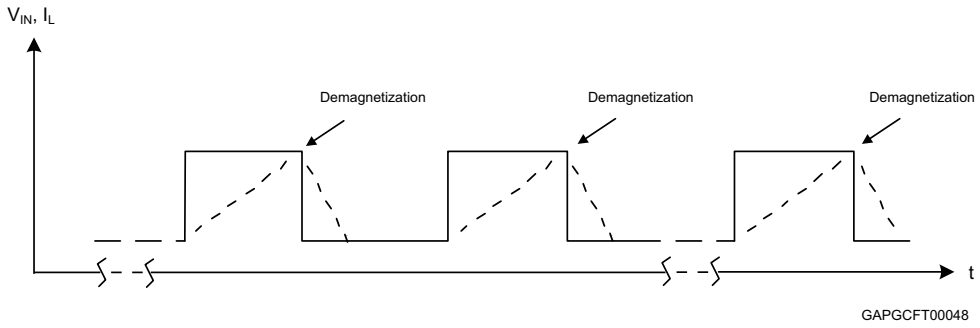
C: T_{jstart} = 125 °C repetitive pulse



1. Values are generated with R_L = 0 Ω.
In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.
