

## High Performance Current Mode PWM Controller

### ■ Features

- Optimized for Off-Line and DC to DC Converters
- Low Start-Up Current ( $\leq 0.5\text{mA}$ )
- Automatic Feed Forward Compensation
- Pulse-by-Pulse Current Limiting
- Enhanced Load Response Characteristics
- Under-Voltage Lockout (UVLO) with Hysteresis
- Double Pulse Suppression
- High Current Totem Pole Output
- Internally Trimmed Bandgap Reference
- Current Mode Operation to 500KHZ
- Low Ro Error Amplifier

### ■ Pin Connections

PDIP-8L, SOP-8L

### ■ General Description

The AP3842/3/4/5 family of control ICs provides the necessary features to implement off-line or DC to DC fixed frequency current mode control schemes with a minimal external parts count. Internally implemented circuits include under voltage lockout featuring start-up current less than 0.5 mA, a precision reference trimmed for accuracy at the error amp input, logic to insure latched operation, a PWM comparator which also provides current limit control, and a totem pole output stage designed to source or sink high peak current. The output stage, suitable for driving N-Channel MOSFETs, is low in the off-state.

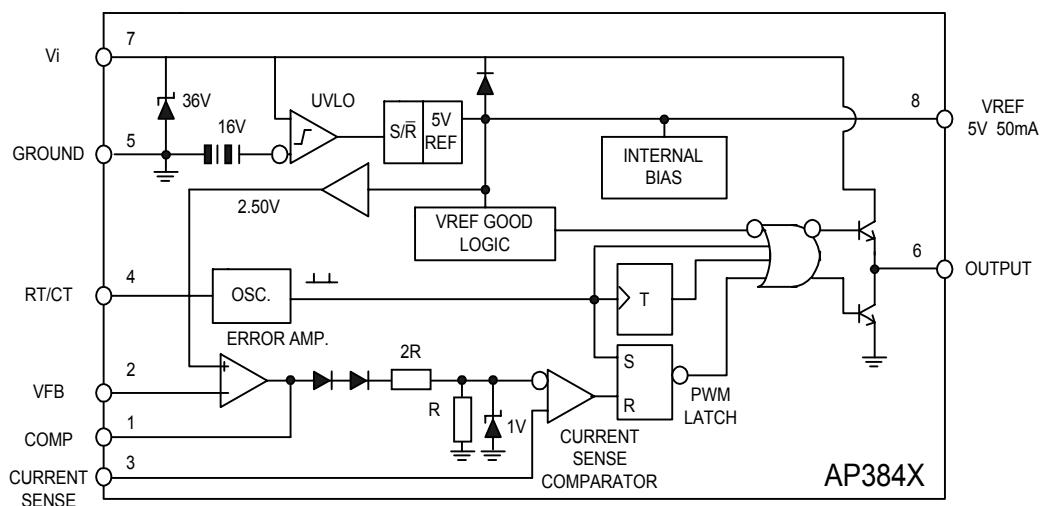

Differences between members of this family are the under-voltage lockout thresholds and maximum duty cycle ranges. The AP3842 and AP3844 have UVLO thresholds of 16V(on) and 10V(off), ideally suited for off-line applications. The corresponding thresholds for the AP3843 and AP3845 are 8.5V and 7.6V. The AP3842 and AP3843 can operate to duty cycles approaching 100%. A range of the zero to < 50% is obtained by the AP3844 and AP3845 by the addition of an internal toggle flip flop which blanks the output off every other clock cycle.

### ■ Ordering Information

Part No.	Package	Lead Free	Packing
2:3842	S8:SOP-8L	Blank : Normal	Blank: Tube
3:3843	N8:PDIP-8L	L : Lead Free Package	A : Taping
4:3844			
5:3845			

## High Performance Current Mode PWM Controller

### ■ Block Diagram ( toggle flip flop used only in AP3844 and AP3845 )

### ■ Absolute Maximum Ratings

Symbol	Parameter	Value	Unit
$V_i$	Supply Voltage (low impedance source)	36	V
$V_i$	Supply Voltage ( $I_i < 30\text{mA}$ )	Self Limiting	
$I_o$	Output Current	$\pm 0.7$	A
$E_o$	Output Energy (capacitive load)	5	$\mu\text{J}$
	Analog Inputs (pins 2,3)	-0.3 to 5.5	V
	Error Amplifier Output Sink Current	10	mA
$P_{tot}$	Power Dissipation at $T_{amb} \leq 50^\circ\text{C}$ (PDIP8)	1.25	W
$P_{tot}$	Power Dissipation at $T_{amb} \leq 25^\circ\text{C}$ (SOP8)	800	mW
$T_{stg}$	Storage Temperature Range	-65 to 150	$^\circ\text{C}$
$T_L$	Lead Temperature (soldering 10s)	260	$^\circ\text{C}$

\*Notes: 1. All voltages are with respect to pin 5, all currents are positive into the specified terminal.

### ■ Electrical Characteristics

(Unless otherwise stated, these specifications apply for  $0 \leq T_{amb} \leq 70^\circ\text{C}$  for AP384X ;  $V_i = 15\text{V}$  (note 5);  $R_T = 10\text{K}\Omega$ ;  $C_T = 3.3\text{nF}$ )

Symbol	Parameter	Test Conditions	AP384X			Unit
			Min.	Typ.	Max.	
<b>REFERENCE SECTION</b>						
$V_{REF}$	Output Voltage	$T_j = 25^\circ\text{C}$ $I_o = 1\text{mA}$	4.90	5.00	5.10	V

## High Performance Current Mode PWM Controller

Notes : 2.These parameters, although guaranteed, are not 100% tested in production.

3.Parameter measured at trip point of latch with  $V_{PIN2}=0$ .

4.Gain defined as:

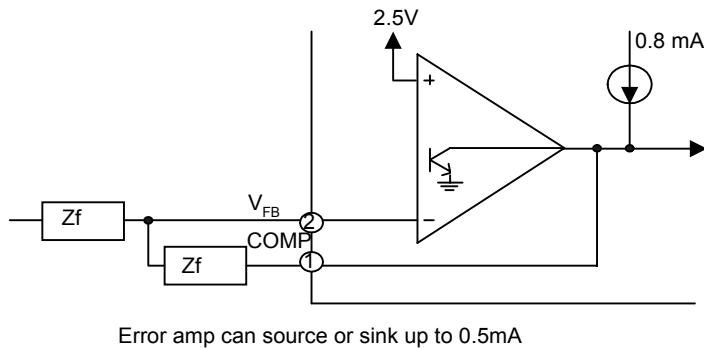

$$A = \frac{\Delta V_{PIN1}}{\Delta V_{PIN3}} ; 0 \leq V_{PIN3} \leq 0.8V$$

5.Adjust  $V_i$  above the start threshold before setting at 15V.

6.Output frequency equals oscillator frequency for the AP3842 and AP3843.

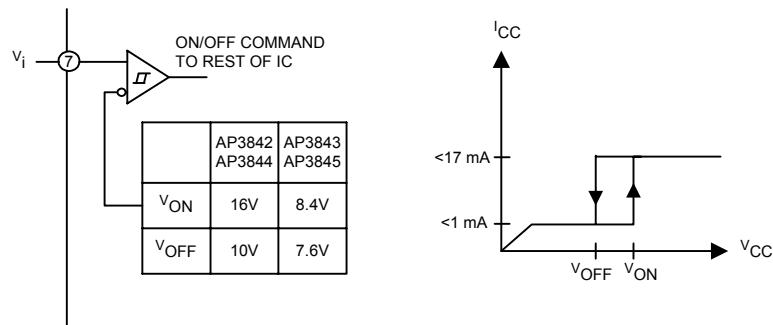

7.Output frequency is one and half oscillator frequency for the AP3844 and AP3845.

**Figure 1 : Error Amp Configuration.**

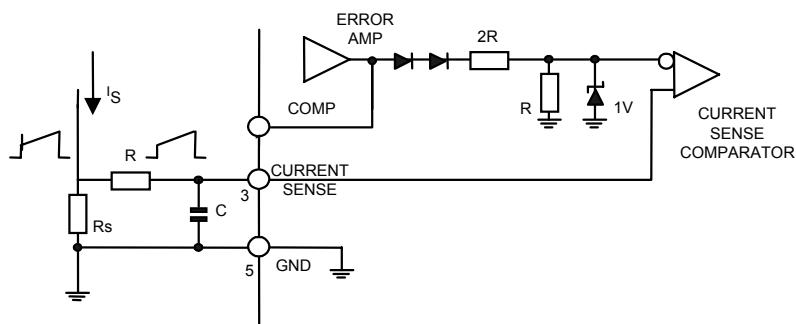

Error amp can source or sink up to 0.5mA

**Figure 2 : Under Voltage Lockout.**

During Under-Voltage Lockout, the output driver is biased to sink minor amounts of current. Pin 6 should be shunted to ground with a bleeder resistor to prevent activating the power switch with extraneous leakage currents.

**Figure 3 : Current Sense Circuit.**

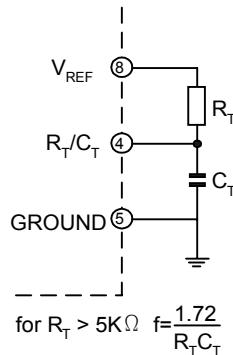

## High Performance Current Mode PWM Controller

Peak current( $i_s$ ) is determined by the formula

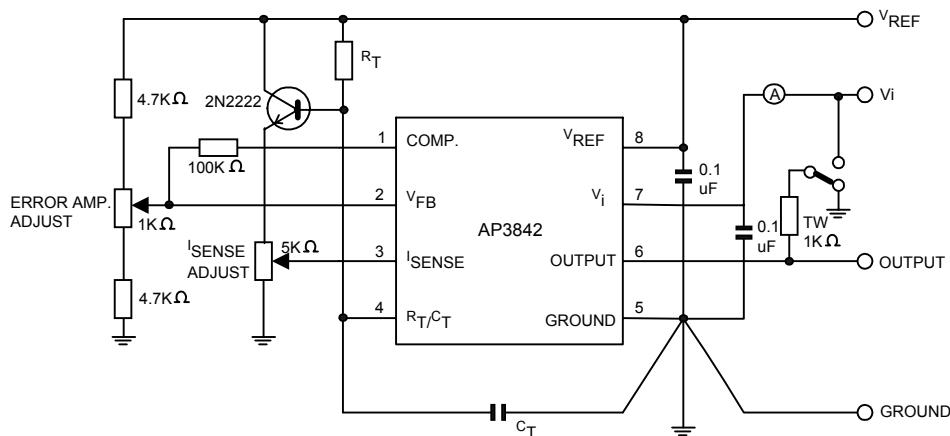

$$I_s \text{ max} \approx \frac{1.0V}{R_s}$$

A small RC filter may be required to suppress switch transients.

**Figure 4.**

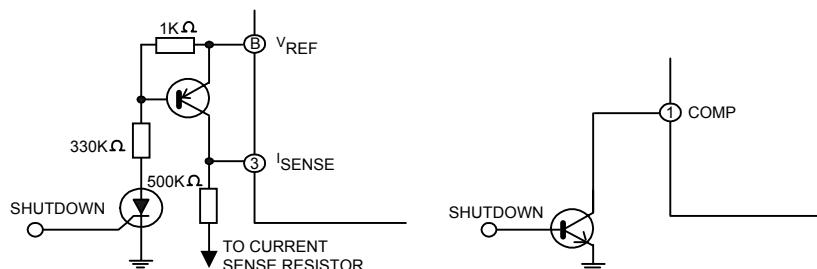

**Figure 5 : Open Loop Test Circuit.**

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5 kΩ potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.

**Figure 6 : Shutdown Techniques.**

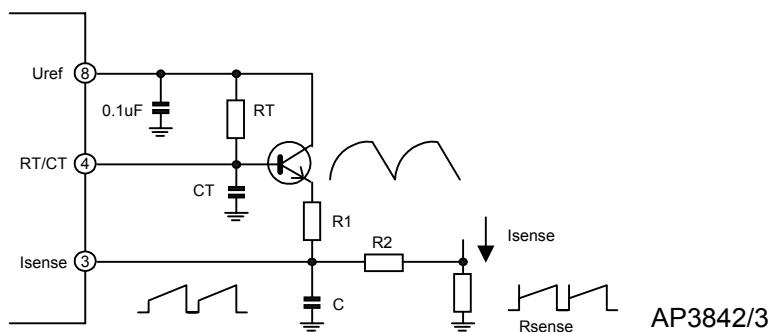

## High Performance Current Mode PWM Controller

---

Shutdown of the AP3842 can be accomplished in two ways; either raise pin 3 above 1V or pull pin 1 below a voltage two diode drops above ground. Either one of them causes the output of the PWM comparator to be high (refer to block diagram). The PWM latch is reset dominant so that the output will remain low until the next clock cycle after the shutdown condition at pins 1 and/or 3 is removed. In one example, an externally latched shutdown may be accomplished by adding an SCR that will be reset by cycling  $V_i$  below the lower UVLO threshold. At this point the reference turns off, allowing the SCR to reset.

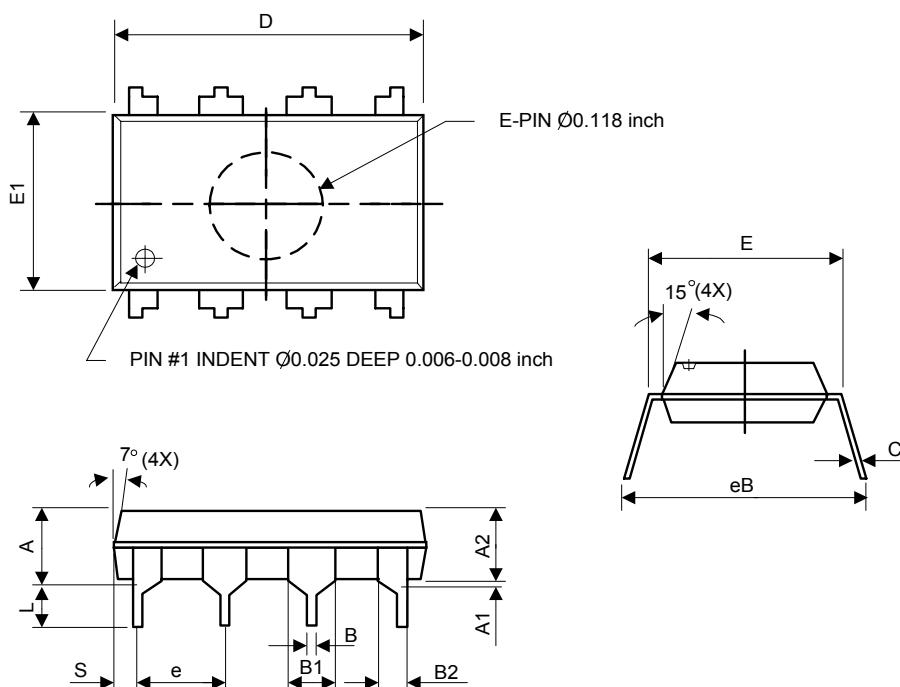

**Figure 7 : Slope Compensation.**

A fraction of the oscillator ramp can be resistively summed with the current sense signal to provide slope compensation for converters requiring duty cycles over 50%. Note that capacitor, C, forms a filter with  $R_2$  to suppress the leading edge switch spikes.
