

### BENEFITS AND FEATURES

- Improves Reliability of Processor Operation
  - Temperature-Compensated Voltage Monitor for Precise, Automated Power-Fail Detection
  - Automatically Restarts a Microprocessor After Power Failure
  - Maintains Reset for 150ms After  $V_{CC}$  Returns to Tolerance for Processor Stabilization
  - Monitors Pushbutton for External Override
  - Active-Low Reset Output
- Efficient Open-Drain Output with Internal 5.5k $\Omega$  Pullup Resistor Saves Power and Space
  - 35 $\mu$ A (max) Quiescent Current
- Allows for Easy Design with No Complicated Settings
  - Fixed 3.3V Reset Threshold
  - 5%, 10%, and 20% Tolerance Versions Available
- Operates in Most Commercial and Industrial Environments
  - -40°C to +85°C Operating Temperature Range
- MXD1818 Offers Improved Performance over the DS1818

### DESCRIPTION

The DS1818 EconoReset uses a precision temperature-compensated reference and comparator circuit to monitor the status of the power supply ( $V_{CC}$ ). When an out-of-tolerance condition is detected, an internal power-fail signal is generated which forces reset to the active state. When  $V_{CC}$  returns to an in-tolerance condition, the reset signal is kept in the active state for approximately 150 ms to allow the power supply and processor to stabilize.

The DS1818 also monitors a pushbutton on the reset output. If the reset line is pulled low, a reset is generated upon release and the DS1818 output will be held in reset output low for typically 150 ms.

## OPERATION - POWER MONITOR

The DS1818 provides the functions of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failures. When  $V_{CC}$  is detected as out-of-tolerance, the  $\overline{RST}$  signal is asserted. On power-up,  $\overline{RST}$  is kept active for approximately 150 ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before  $\overline{RST}$  is released.

## APPLICATION EXAMPLE Figure 2

## OPERATION - PUSHBUTTON RESET

The DS1818 provides a pushbutton switch for manual reset control. When the DS1818 is not in a reset cycle, a pushbutton reset can be generated by pulling the  $\overline{RST}$  pin low for at least  $1\ \mu\text{s}$ . When the pushbutton is held low, the  $\overline{RST}$  is forced active low and will remain active low for about 150 ms after the pushbutton is released. See Figure 2 for an application example and Figure 3 for the timing diagram.

**NOTES:**

1. All voltages are referenced to ground.
2. Measured with  $V_{CC} \geq 2.7V$ .
3. A  $1\text{ k}\Omega$  external pull-up resistor may be required in some applications for proper operation of the microprocessor reset control circuit.
4. Measured with  $\overline{\text{RST}}$  output open.
5. Measured with  $2.7V \leq V_{CC} \leq 3.3V$ .
6.  $t_R = 5\ \mu\text{s}$ .
7.  $V_{OH}$  and  $I_{OH}$  are a function of the value of  $R_P$  and the associated output load conditions.
8. The  $t_F$  value is for reference in defining values for  $t_{RPD}$  and should not be considered a requirement for proper operation or use of the device.
