Bi-CMOS LSI

## Electronic Volume IC for Car Audio Systems

ON Semiconductor®

<http://onsemi.com>

### Overview

The LV3313PM is an electronic volume IC that implements a rich set of audio control functions including input selection switching function, an input gain, volume, loudness, balance, fader, and bass/treble control.

### Features

- Zero-cross switching circuits (Input gain control block and Volume control block) can switch signal detection location automatically.
- Zero-cross switching circuits (Input gain control block and Volume control block) and soft mute circuits used for low noise even when input signals are present.
- Low power consumption due to the use of BiMOS process.
- All functions are controlled using serial data (CCB).

### Functions

- Input selector :  
Four input signals can be selected (three single-ended inputs and one differential input).
- Input gain control :  
The input signal can be amplified by 0dB to +18dB (1dB steps).
- Loudness control :  
Taps are output starting at the -32dB position of the ladder resistor and a loudness function implemented with external capacitor and resistor components.
- Volume control : +10dB to -79dB/-∞ (1dB steps)  
L/R independent control.
- Bass control : +12dB to -12dB in 2dB steps
- Treble control : +12dB to -12dB in 2dB steps
- Fader control :  
The fader volume can be attenuations by one of 16 levels. Independent control each four channels. (A total of 16 settings with attenuations of 0dB to -2dB in 1dB steps, -2dB to -20dB in 2dB steps, and -30dB, -45dB, -60dB and -∞dB settings.)
- Mute

• CCB is ON Semiconductor®'s original format. All addresses are managed by ON Semiconductor® for this format.

- CCB is a registered trademark of Semiconductor Components Industries, LLC.

## Specifications

**Absolute Maximum Ratings** at  $T_a = 25^\circ\text{C}$ ,  $V_{SS} = 0\text{V}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	$V_{DD}$ max	$V_{DD}$	9.5	V
Maximum input voltage	$V_{IN}$ max	All input pins	$V_{SS}-0.3$ to $V_{DD}$	V
Allowable power dissipation	$P_d$ max	$T_a \leq 85^\circ\text{C}$ , when mounted on a printed circuit board *	600	mW
Operating temperature	$T_{opr}$		-40 to +85	$^\circ\text{C}$
Storage temperature	$T_{stg}$		-50 to +125	$^\circ\text{C}$

\* Specified circuit board :  $114.3 \times 76.1 \times 1.6\text{mm}^3$  : glass epoxy board

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

**Allowable Operating Ratings** at  $T_a = 25^\circ\text{C}$ ,  $V_{SS} = 0\text{V}$

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Supply voltage	$V_{DD}$	$V_{DD}$	7.0	8.0	9.0	V
High-level input voltage	$V_{IH}$	CL, DI, CE	3.0		5.5	V
Low-level input voltage	$V_{IL}$	CL, DI, CE	$V_{SS}$		1.0	V
Input voltage amplitude	$V_{IN}$		$V_{SS}$		$V_{DD}$	Vp-p
Input pulse width	$T_{\phi W}$	CL	1			$\mu\text{s}$
Setup time	$T_{setup}$	CL, DI, CE	1			$\mu\text{s}$
Hold time	$T_{hold}$	CL, DI, CE	1			$\mu\text{s}$
Operating frequency	fopg	CL			500	kHz
Rising time	$t_r$	CL, DI, CE			0.1/fopg	s
Falling time	$t_f$					

**Electrical Characteristics** at  $T_a = 25^\circ\text{C}$ ,  $V_{DD} = 8\text{V}$ ,  $V_{SS} = 0\text{V}$

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
<b>Input block</b>

## Pin Functions

Pin No.	Pin name	Function	Equivalent Circuit
36 35 34 42 43 44	L1 L2 L3 R1 R2 R3	Single end input pins.	
33 32 1 2	L4M L4P R4M R4P	Differential input pins.	
31 3	LSELO RSELO	Input selector output pins.	
30 4	LVRIN RVRIN	Main volume input pins.	
29 5	LCT RCT	Loudness function pins.	
24 10	LVROUT RVROUT	Tone output pins.	
23 11	LFIN RFIN	Fader block input pins. Drive at low impedance.	
22 21 12 13	LFOUT LROUT RFOUT RROUT	Fader output pins. Attenuation is possible separately for the front end and rear end.	

Continued on next page.

# LV3313PM

Continued from preceding page.

Pin No.	Pin name	Function	Equivalent Circuit
41	Vref	Connect a capacitor of a few tens of uF between Vref and AVSS (VSS) as a 0.55 × VDD voltage generator, current ripple countermeasure.	
15	VREG	Internal logic voltage pin.	
37	VDD	Power supply pin.	
20	AVSS	Ground pin.	
38	MUTE	External muting control pin. Setting this pin to VSS level sets forcibly fader volume block to -∞ level.	
27 26 25 7 8 9	LF1C1 LF1C2 LF1C3 RF1C1 RF1C2 RF1C3	Capacitor connection pins for configuring equalizer bass band filter. Connect a capacitor between LF1C1 (RF1C1) and LF1C2 (RF1C2), and between LF1C2 (RF1C2) and LF1C3 (RF1C3).	
28 6	LF3C1 RF3C1	Capacitor connection pins for configuring equalizer treble band filter. Connect a high band compensation capacitor between LF3C1 (RF3C1) and VSS.	
17 18	CL DI	Input pin for serial data and clock used for control.	
19	CE	Chip enable pin. Data is written to the internal latch and the analog switches are operated when the level changes from High to Low. Data transfer is enabled when the level is High.	

Continued on next page.

# LV3313PM

Continued from preceding page.

Pin No.	Pin name	Function	Equivalent Circuit
39	TEST	IC test pin. Normally this pin is OPEN.	
14	DV <sub>SS</sub>	Logic system ground pin.	
16	OSC	External oscillat input pin. Normally this pin is OPEN.	
40	PH	Automatic zero cross detection pin.	

## Usage Cautions

### (1) Data Transmission at power on

- The status of internal analog switches is unstable at power on. Therefore, perform muting or some other countermeasure until the data has been set.
- At power on, initial setting data must be sent once in order to stabilize the bias of each block in a short time.

### (2) Description of zero cross switching circuit operation

The LV3313PM have a function to switch zero cross comparator signal detection locations, enabling the selection of the optimum detection location for blocks whose data is to be updated. Basically, the switching noise can be minimized by inputting the signal immediately following the block whose data is to be updated to the zero cross comparator, so it is necessary to switch the detection location every time.

LV3313PM zero cross detection circuit

### (3) Zero Cross Switching Control method

The zero cross switching control method consists of setting the zero cross control bits to the zero cross detection mode, and specifying the detection blocks before transmitting the data. These control bits are latched immediately following data transfer, that is to say beforehand in sync with the falling edge of CE, so when updating data of volumes, etc., it is possible to perform mode setting and zero cross switching with one data transfer.

### (4) Soft mute operation

The LV3313PM have a soft mute function for low switching noise, when this mute function set operation. (mute/unmute function select)

The Soft mute time can be selected by send to CCB control. (0.6ms, 5ms, 40ms, 80ms)

A soft mute function can be implemented by set to soft mute on. (Set to mute on/off)
