

### Features

- 3 Regulated Voltage are provided
  - SYNC Switching Power for VTT(1.25V)
  - ASYNC Switching Power for NVVDD(2.05V)
  - Linear Regulator for FBVDDQ(2.5V)
- Simple Single-Loop Control Design
  - Voltage-Mode PWM Control
- Excellent Output Voltage Regulation
  - VTT Output:  $\pm 1\%$  Over Temperature
  - NVVDD Output:  $\pm 2\%$  Over Temperature
  - FBVDDQ Output:  $\pm 2.5\%$  Over Temperature
- Fast Transient Response
  - On-Chip Feedback Compensation
  - Full 0% to 100% Duty Ratio
- Power-Good Output Voltage Monitor
- Over-Voltage and Over-Current Fault Monitors
- Small Converter Size
  - Constant Frequency Operation(200kHz)
  - Programmable Oscillator from 50kHz to 800KHz
  - Reduce External Component Count

### Applications

- VGA Card Power Regulation

### General Description

The APW7026 Provides the power control and protection for three output voltages in VGA Card applications. It integrates two PWM controllers, one linear controller as well as the monitoring and protection functions into a single package. One PWM controller (PWM1) regulates the termination voltage VTT(1.25V) with a synchronous-rectified buck converter. The second PWM controller (PWM2) supplies the Core power NVVDD ( 2.05V ) with a standard buck converter . The linear controller regulates 2.5V power for FBVDDQ.

The APW7026 can monitor all the output voltages (VTT ,NVVDD,FBVDDQ) and a single power good signal is issued when the VTT is within  $\pm 10\%$  of the reference voltage ( $V_{REF1}$ ) and the other levels are above its lower power good threshold voltage. Additional built-in overvoltage protection (OVP) will be started when the VTT output is above 118% of the  $V_{REF1}$ .The OVP function will shutdown the upper MOSFET and turn on the lower MOSFET until the over-voltage is disappeared. The PWM controllers over-current function monitors the output current by sensing the voltage drop across the upper MOSFET  $r_{DS(ON)}$ , eliminating the need for a current sensing resistor.

### Pin Description

ANPEC reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

## Functional Pin Description

### UGATE1 (Pin 1)

Connect UGATE1 pin to the SYNC PWM Converter's upper MOSFET gate .This pin provides the gate drive for the upper MOSFET.

### VCC (Pin 2)

Provide a +12V bias supply for the IC to this pin . This pin also provides the gate bias charge for all the MOSFETs controlled by the IC. The voltage at this pin is monitored for Power-On Reset (POR) purpose.

### UGATE2 (Pin 3)

Connect UGATE2 pin to the ASYNC PWM converter's MOSFET gate . This pin provides the gate drive for the MOSFET.

### PHASE2 (Pin 4)

Connect the PHASE2 pin to the ASYNC PWM converter's MOSFET source. This pin is used to monitor the voltage drop across the MOSFET for over-current protection.

### PGOOD (Pin 5)

PGOOD is an open drain output used to indicate the status of the output voltages. This pin is pulled low when the SYNC PWM regulator output is not within ± 10%

of the reference voltage (V<sub>REF1</sub>) or when V3.3 or V<sub>FB3</sub> is below its lower power good threshold.

### OCSET2 (Pin 6)

Connect a resistor (R<sub>OCSET</sub>) from this pin to the drain of the ASYNC PWM converter's MOSFET . R<sub>OCSET</sub>, an internal 200µA current source (I<sub>OCSET</sub>), and the MOSFET's on-resistance (r<sub>DS(ON)</sub>) set the converter's over-current (OC) trip point according to the following equation:

$$I_{PEAK} = \frac{I_{OCSET} \times R_{OCSET}}{r_{DS(ON)}}$$

An over-current trip cycles the soft-start function.

### FB2 (Pin 7)

Connect this pin to the output of the ASYNC PWM converter . The voltage at this pin is regulated to the reference voltage V<sub>REF2</sub>. A resistor divider is connected from this pin to V<sub>OUT2</sub>(R<sub>OUT2</sub>) and to GND(R<sub>GND2</sub>) that sets the output voltage as the following equation :

## Functional Pin Description Cont.

$$V_{OUT2} = \left(1 + \frac{R_{OUT2}}{R_{GND2}}\right) \times V_{REF2}$$

The value of the resistor connected from  $V_{OUT2}$  to FB2 must be less than 150 $\Omega$ .

### V5 (Pin 8)

The +5V input voltage at this pin is monitored for power-on reset (POR) purpose.

### SS (Pin 9)

This pin provides the soft-start for the all PWM converters and linear regulator. An internal resistor charges an external capacitor that is connected from 5V supply to this pin which ramps up the all outputs, preventing the outputs from overshooting as well as limiting the input current. The second function of the soft-start cap is to provides long off time for the synchronous MOSFET during current limiting.

### FAULT / RT (Pin 10)

This pin provides oscillator switching frequency adjustment. By placing a resistor ( $R_T$ ) from this pin to GND, the nominal 200kHz switching frequency is increased. Conversely, connecting a pull-up resistor ( $R_T$ ) from this pin to VCC reduces the switching frequency. Nominally, the voltage at this pin is 1.26V. In the event of an over-voltage or over-current condition, this pin is internally pulled to VCC.

### V3.3 (Pin 11)

This pin is connected to the +3.3V or the output of the ASYNC PWM converter for power good and over-voltage detection. When the output voltage of the ASYNC PWM converter is not in the range from 3V to 4V, connect this pin to +3.3V voltage.

### GND (Pin 12)

Signal ground for the IC. All voltage levels are measured with respect to this pin.

### GATE (Pin 13)

Connect this pin to the gate of an external MOSFET. This pin provides the drive for the linear regulator's

pass MOSFET.

### FB3 (Pin 14)

Connect this pin to the output of the linear regulator. A resistor driver is connected from this pin to  $V_{OUT3}$  and GND that sets the output voltage as same as  $V_{OUT2}$ . This pin is monitored for power good function.

### FB1 (Pin 15)

This pin provides the feedback for the SYNC PWM converter. Typically this pin can be connected directly to the output of the converter. However, a resistor divider is recommended to be connected from this pin to  $V_{OUT1}$  and GND to adjust the output voltage as same as  $V_{OUT2}$ . The value of the resistor connected from  $V_{OUT1}$  to FB1 must be less than 200 $\Omega$ .

### VSEN1 (Pin 16)

This pin is connected to the SYNC PWM converter's output voltage. The PGOOD and OVP comparator circuits use this signal to report output voltage status and over-voltage protection.

### OCSET1 (Pin 17)

Connect a resistor ( $R_{OCSET}$ ) from this pin to the drain of the SYNC PWM converter's upper MOSFET. The over-current (OC) trip point for the SYNC PWM converter is set by the  $R_{OCSET}$  as same as the OCSET2. An over-current trip cycles the soft-start function.

### PGND (Pin 18)

This is the power ground connection. Tie the SYNC PWM converter's lower MOSFET source to this pin.

### LGATE1 (Pin 19)

Connect LGATE1 to the SYNC PWM converter's lower MOSFET gate. This pin provides the gate drive for the lower MOSFET.

### PHASE1 (Pin 20)

Connect the PHASE1 pin to the SYNC PWM Converter's upper MOSFET source. This pin is used to monitor the voltage drop across the upper MOSFET for over-current protection.

Typical Performance Curves

Note : The Reference Voltage( $V_{REF}$ ) Deviation is

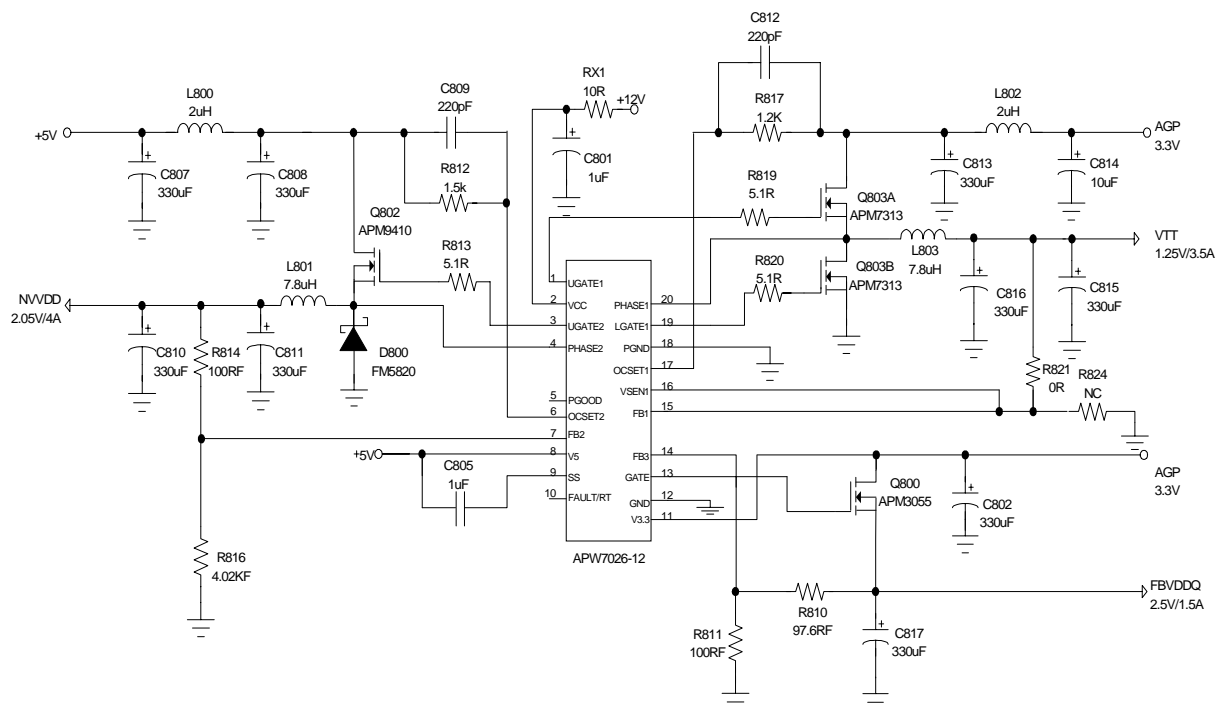

$$\frac{V_{REF}(T_J) - V_{REF}(25^{\circ}C)}{V_{REF}(25^{\circ}C)} \times 100\%$$

$T_J$  is Junction Temperature.
