

**S<sup>2</sup>C Controlled, Serial LED Boost Driver**

**General Description**

The AHK1421 is a highly integrated, high efficiency LED backlight solution for portable appliances including mobile phones, smartphones, PDAs, PNDs etc. The device operates from a single-cell Li-ion or polymer battery in the voltage range from 2.7V to 5.5V.

An integrated boost (step-up) converter provides up to 28V output for driving up to 6 series LEDs. In conjunction with an external current setting ballast resistor, the AHK1421 uses a single wire, S<sup>2</sup>C digital interface to adjust the output current and therefore brightness, in 32 linear steps.

The boost switching frequency operates at 1MHz to allow optimum efficiency and the smallest external L/C filtering components. Integrated protection features protects against, open circuit LEDs, short circuits and over temperature conditions.

The AHK1421 is available in a Pb-free TSOT23-6 package.

**Features**

- Input Voltage Range: 2.7 to 5.5V
- Drives up to 6 Series LEDs at 31mA
- Integrated Boost Converter
  - 1MHz Switching Frequency
  - Up to 86% Efficiency
  - Internal Compensation
- 32 Steps - S<sup>2</sup>Cwire Single Wire Interface
- Shutdown Current < 4μA
- Integrated Protection Features
  - Over-Voltage Protection for Open-LED Faults
  - Over Temperature Protection
- TSOT23-6 package

**Applications**

- White LED backlight
  - Feature phones
  - Smartphones
  - PDAs
  - PMP
  - PNDs
  - Portable DVD Players

**Typical Application**

## S<sup>2</sup>C Controlled, Serial LED Boost Driver

### Pin Descriptions

Pin #	Symbol	Function	Description
1	LX	O	Switching node of boost converter. Connect a 10 $\mu$ H inductor between this pin and input voltage source.
2	GND	GND	Ground.
3	FB	I	Feedback pin from LED ballast resistor. Connect a resistor to ground to set the maximum LED current.
4	EN/SET	I	Enable on/off control and S <sup>2</sup> Cwire interface input.
5	OUT	O	Output of boost converter. Connect to the anode of the first LED in the series string.
6	VIN	I	Input voltage to IC. Tied to input voltage source and input boost inductor.

### Pin Configuration

### Absolute Maximum Ratings<sup>1</sup>

Symbol	Description	Value	Units
V <sub>LX</sub> , V <sub>OUT</sub>	LX or OUT voltage to GND	28	V
V <sub>IN</sub> , V <sub>EN/SET</sub>	VIN, EN/SET to GND Voltage	-0.3 to 6	
V <sub>FB</sub>	FB to GND Voltage	-0.3 to VIN	
T <sub>J</sub>	Junction Operating Temperature	-40 to 140	°C
T <sub>LEAD</sub>	Soldering Temperature (at leads, 10 sec.)	300	

### Thermal Information<sup>2</sup>

Symbol	Description	Value	Units
Θ <sub>JA</sub>	Thermal Resistance	139	°C/W
P <sub>D</sub>	Maximum Power Dissipation	0.719	W

DISCONTINUED

1. Stresses above those listed in Absolute Maximum Ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied.  
2. Mounted on an FR4 board.

## Functional Block Diagram

## Functional Description

The AHK1421 is a highly integrated, high efficiency white LED backlight solution for mobile phones and all battery operated equipment. The device operates from regulated DC inputs, and single-cell Li-ion batteries in the voltage range 2.7V to 4.2V.

The integrated boost (step-up) converter provides up to 28V output to drive up to 6 series LEDs. The LED current is set by a single external resistor up to 31mA. S<sup>2</sup>C single wire interface can enable and disable the IC and adjust the dimming in 32 steps.

The AHK1421 is available in a Pb-free 6-pin TSOT23 package.

The over-voltage protection function is designed to protect the boost converter during the fault of the open circuit of the LED string. The over-temperature function is targeted to protect the converter if an over-temperature fault occurs.

## Soft Start / Enable

The AHK1421 is enabled by EN/SET pulled to high after power on with a certain delay time. Internal soft start circuitry limits the input inrush current and eliminates output voltage overshoot. When EN/SET is pulled low, the AHK1421 enters a low-power, non-switching state. The total input current during shutdown is less than 4 $\mu$ A.

## Over-Temperature Protection

Thermal protection disables the AHK1421 when internal dissipation becomes excessive. Thermal protection disables the power MOSFET. The junction over-temperature threshold is 140°C with 15°C of temperature hysteresis. The output voltage automatically recovers when the over-temperature fault condition is removed.

## Over-Voltage Protection

Over-voltage protection prevents damage to the AHK1421's pin during LED open-circuit or high output voltage conditions. An over-voltage event is defined as a condition where the voltage on the OUT pin exceeds the over-voltage protection threshold ( $V_{OVP}$ ). When  $V_{OVP}$  has

## S<sup>2</sup>C Controlled, Serial LED Boost Driver

reached the threshold limit, the converter stops switching and the output voltage decays. Switching resumes when the lower hysteresis limit of  $V_{OVP}$  is reached, thereby maintaining an average output voltage between the upper and lower OVP thresholds.

### LED Current Setting

The maximum LED current is determined by the  $R_{FB}$  resistor value. With a fixed 0.25V voltage on  $R_{FB}$ , the LED maximum current is a linear ratio to the current flowing through  $R_{FB}$ .

$$I_{LED} = \frac{V_{FB}}{R_{FB}}$$

Where  $V_{FB} = 0.25V$

Table 1 lists examples of calculated  $R_{FB}$  resistor values for different maximum LED current requirements. Higher accuracy  $R_{FB}$  resistor can get higher accurate LED current.

Maximum LED Current (mA)	$R_{FB}$ ( $\Omega$ )
31	8.06
30	8.33
20	12.5
15	16.66
12	20.83
10	25

**Table 1: Examples of  $R_{FB}$  Values for Setting Maximum LED Current Levels.**

The LED dimming is controlled in 32-steps using the S<sup>2</sup>Cwire single-wire interface via the EN/SET pin. 32 S<sup>2</sup>Cwire rising-edge steps set the LED current from 100% to 2% of the maximum LED current.

### S<sup>2</sup>Cwire Serial Interface Timing

**Figure 1: S<sup>2</sup>Cwire Timing Diagram.**

### S<sup>2</sup>Cwire™ Serial Interface

The LED current magnitude can be controlled by the EN/SET pin using the S<sup>2</sup>Cwire interface. The interface records rising edges of the EN/SET pin and decodes them into 32 individual current level settings. Code 1 is full scale (maximum LED current), and Code 32 is 2% of the full scale. The modulo 32 interface wraps states back to state 1 after the 32nd clock. The counter can be clocked at speeds up to 1MHz, so intermediate states are not visible. The first rising edge of EN/SET enables the IC and initially sets the output LED current to full scale after  $500\mu s$   $t_{LAT}$ . Once the final clock cycle is input for the desired brightness level, the EN/SET pin should be held high to maintain the device output current at the programmed level. The device is disabled  $500\mu s$  after the EN/SET pin enters a logic low state. The EN/SET timing is designed to accommodate a wide range of data rates from 20kHz to 1MHz.

After the first rising edge of EN/SET, the boost converter is enabled and reaches full capacity after the soft-start time. Exact counts of clock pulses for the desired current level should be entered on the EN/SET pin with a single burst of clocks. The counter refreshes each time a new clock input to the EN/SET pin is detected. A constant current is maintained as long as EN/SET remains in a logic high state. To save power, the boost converter is switched off after EN/SET has remained in the low state for at least the  $t_{OFF}$  timeout period as shown in Figure 1.

## S<sup>2</sup>C Controlled, Serial LED Boost Driver

### Application Information

#### LED Current Setting

LED current dimming is controlled via the S<sup>2</sup>Cwire single-wire interface through the EN/SET pin in 32 steps. The S<sup>2</sup>Cwire interface programs the LED current from the maximum LED current set by R<sub>FB</sub> to 2% of the maximum LED current as shown in Table 2.

S <sup>2</sup> Cwire Data	LED Current (% I <sub>MAX</sub> )	S <sup>2</sup> Cwire Data	LED Current (% I <sub>MAX</sub> )
1	100	17	48
2	97	18	45
3	94	19	42
4	90	20	39
5	87	21	35
6	84	22	32
7	81	23	29
8	77	24	26
9	74	25	23
10	71	26	19
11	68	27	16
12	65	28	13
13	61	29	10
14	58	30	6
15	55	31	3
16	52	32	2

**Table 2: S<sup>2</sup>Cwire Dimming Control Current Settings.**

#### Capacitor Selection

A 2.2μF/10V input capacitor is recommended and a 2.2μF/50V output capacitor is suitable as noted above. Multi-layer ceramic (MLC) capacitors provide small size and adequate capacitance, low parasitic equivalent series resistance (ESR) and equivalent series inductance (ESL), and are well suited for use as input, output and compensation capacitors in the AHK1421 step-up con-

verter LED driver application. MLC capacitors of type X7R or X5R are recommended to ensure good capacitance stability over the full operating temperature range. Table 3 lists some recommended capacitors for use with the AHK1421.

#### Inductor Selection

Inductor value, saturation current and DCR is most important parameter in selecting an inductor for AHK1421. The suitable inductance range for the AHK1421 is 4.7μH to 22μH. Higher inductance lowers the step-up converter's RMS current value. Together with lower DCR value of the inductor, it makes the total inductor power loss become much lower. Considering inductor size and cost, 10μH inductance is most suitable.

Inductor saturation current is a key parameter in selecting an inductor. For the step-up converter, the peak inductor current is the DC input current plus half the inductor peak-to-peak current ripple.

DC input current is given by:

$$I_{IN} = \frac{V_{OUT} \cdot I_{LED}}{V_{IN} \cdot \eta}$$

Inductor peak-to-peak current ripple:

$$I_{L\_PP} = \frac{V_{IN} \cdot (V_{OUT} - V_{IN})}{V_{OUT} \cdot L \cdot f}$$

Inductor peak current:

$$I_{L\_PEAK} = I_{IN} + \frac{I_{L\_PP}}{2} = \frac{V_{OUT} \cdot I_{LED}}{V_{IN} \cdot \eta} + \frac{V_{IN} \cdot (V_{OUT} - V_{IN})}{2 \cdot V_{OUT} \cdot L \cdot f}$$

For example, for a white LED with 3.2V V<sub>F</sub> and 20mA current at 82% efficiency, the inductor peak current for 6LEDs in a string is:

$$I_{L\_PEAK} = \frac{3.2 \cdot 6 \cdot 0.02}{3.6 \cdot 0.82} + \frac{3.6 \cdot (3.2 \cdot 6 - 3.6)}{2 \cdot 3.2 \cdot 6 \cdot 10\mu \cdot 1M} = 276mA$$

Manufacturer	Part Number	Value (μF)	Voltage (V)	Temperature Range	Case Size
Murata	GRM188R61A225K	2.2	10	X5R	0603
	GRM31CR71H225K	2.2	50	X7R	1206

**Table 3: Examples of AHK1421 Input and Output Capacitor Selection.**

***S<sup>2</sup>C Controlled, Serial LED Boost Driver***

For the inductor copper loss, the inductor DCR value together with the RMS current value flowing through the inductor leads to inductor conduction loss and also affects total efficiency. Larger DCR leads to larger conduction loss and decreases total efficiency. The inductor conduction loss can be estimated as shown in the equation:

$$P_{L\_LOSS} = I_{L\_RMS}^2 \cdot DCR$$
$$= \frac{1}{3} \cdot (I_{L\_MAX}^2 + I_{L\_MIN}^2 + I_{L\_MAX} \cdot I_{L\_MIN}) \cdot DCR$$

$I_{L\_MAX}$  and  $I_{L\_MIN}$  are the inductor peak current and minimum current.

Table 4 gives some examples of recommended inductors for use with the AHK1421.

**Schottky Diode Selection**

To achieve maximum efficiency, a low  $V_F$  Schottky diode is recommended. The diode voltage rating should be higher than the OVP voltage. For an AHK1421 driving 6 white LEDs with up to 4V forward voltage, the diode voltage rating should be higher than 24V. Select a diode with DC rated current equal to the input current to allow an adequate margin for safe use. Table 5 gives some examples of recommended Schottky diodes for use with the AHK1421.
