12-bit to 24-bit Registered Bus Exchanger with 3-state Outputs

HITACHI

ADE-205-137 (Z)
Preliminary 1st. Edition
May 1996

Description

The HD74ALVCH16270 is used in applications where data must be transferred from a narrow high speed bus to a wide lower frequency bus. The device provides synchronous data exchange between the two ports. Data is stored in the internal registers on the low to high transition of the clock (CLK) input when the appropriate $\overline{\text{CLKEN}}$ inputs are low. The select ($\overline{\text{SEL}}$) line selects 1B or 2B data for the A outputs. For data transfer in the A to B direction, a two stage pipeline is provided in the A to 1B path, with a single storage register in the A to 2B path. Proper control of the $\overline{\text{CLKENA}}$ inputs allows two sequential 12-bit words to be presented synchronously as a 24-bit word on the B port. Data flow is controlled by the active low output enables ($\overline{\text{OEA}}$, $\overline{\text{OEB}}$). The control terminals are registered to synchronize the bus direction changes with CLK. Active bus hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

Features

- $V_{\text{CC}} = 2.3 \text{ V to } 3.6 \text{ V}$
- Typical V_{OL} ground bounce $< 0.8 \text{ V}$ ($@V_{\text{CC}} = 3.3 \text{ V, } T_a = 25^\circ\text{C}$)
- Typical V_{OH} undershoot $> 2.0 \text{ V}$ ($@V_{\text{CC}} = 3.3 \text{ V, } T_a = 25^\circ\text{C}$)
- High output current $\pm 24 \text{ mA}$ ($@V_{\text{CC}} = 3.0 \text{ V}$)
- Bus hold on data inputs eliminates the need for external pullup / pulldown resistors

2. This value is limited to 4.6 V maximum.
3. The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils.
