

DESCRIPTIONS

AD6392 is a 4-CH BTL driver suitable for driving motors and actuators in CD-P/VCD-P systems. Each channel drivers except the spindle driver have an internal primary filter and they can be directly connected to the servo's PWM output without any attached external components.

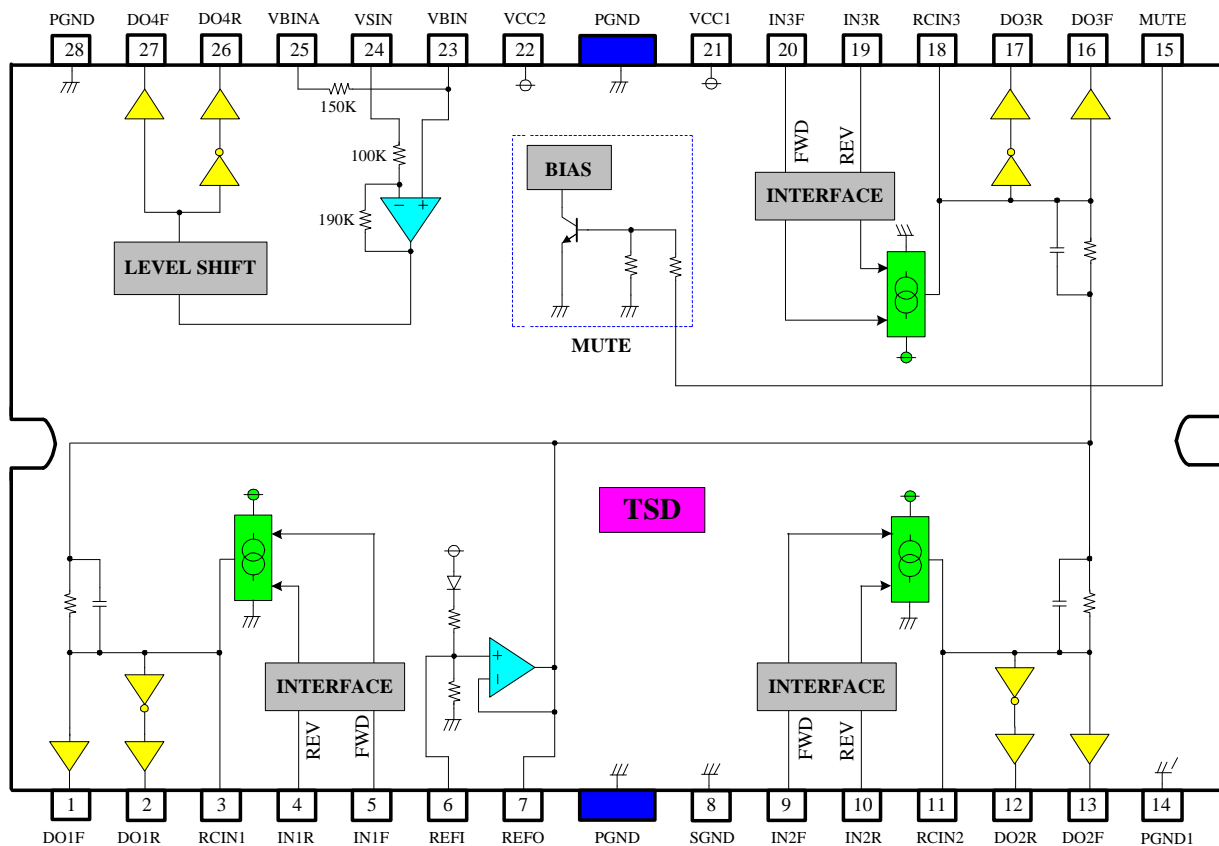

FEATURES

- 3-CH BTL driver compatible with PWM input (PWM input is filtered by an internal primary filter, so there is no need to attach external components)
- 1-CH BTL spindle driver with analog input
- Built-in TSD (thermal shut down) circuit.
- Built-in mute circuit.
- Operating supply voltage (4.5V~13.2V).

ORDER INFORMATION

Device	Package	Operating Temp
AD6392	28SSOPH-375A	-35°C ~ +85°C
AD6392	28SSOPH-375B	-35°C ~ +85°C

APPLICATION SUMMARY

- Mute function through power reference or signal reference pins

Muting all channel drivers can be obtained through power reference or signal reference pins. Fig.1 shows the simplified schematic diagram for power/signal reference mute.

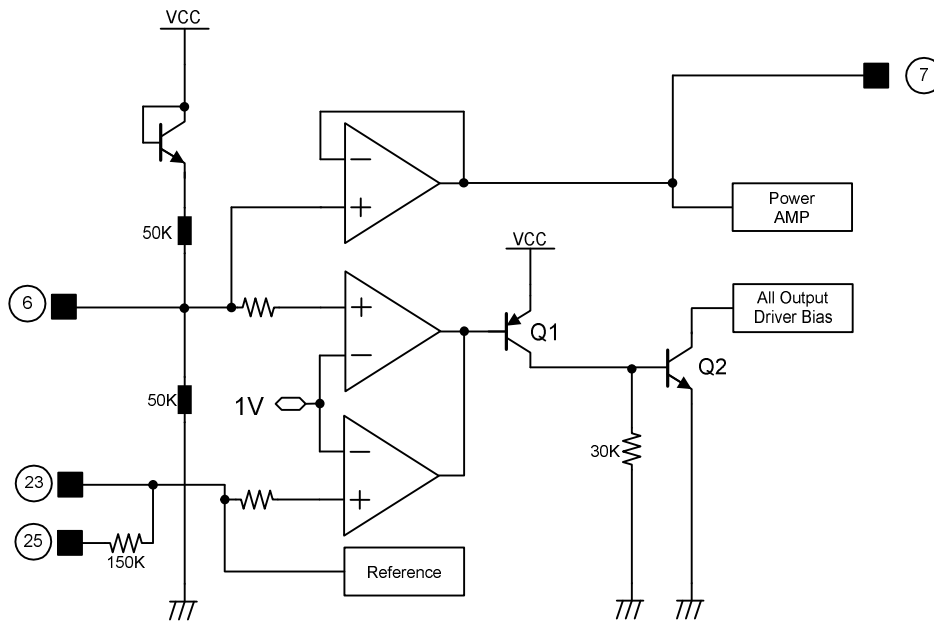

Fig. 1 Power reference, Signal reference & all mute function

Pin6, Pin23, Pin25	Mute
Above 1.0V	off
Below 1.0V	on

As it can be seen in Fig. 1, pin6, pin23 and pin25 are connected to the positive input terminals of comparators, and the internal 1.0V reference is connected to the negative input terminals. Thus, if the voltage applied to each pins falls below 1.0V, Q1 and Q2 become on and hence the bias currents for all channel drivers become to be shut down. Thus all mute function can be carried out.

APPLICATION SUMMARY (Continued)

- Mute function through MUTE pin

Mute function is also performed at MUTE pin (pin15). The logic is as follows:

Pin15	Mute
High	off
Low	on

As it can be seen in Fig. 2, If the voltage of the pin15 become low (below 0.5V) or open, Q3 becomes off and Q4 on, and hence the bias currents for all channel drivers are shut down and muted. If the voltage of the pin15 become high (above 2.0V), the channel drivers operate normally.

Fig. 2 Mute function

- Thermal shutdown (TSD)

The AD6392 has a thermal protection against the abnormal high temperature operation to protect the chip.

Temperature	mute
Above 175 °C	on
Falls below 150 °C	off
Hysteresis	25 °C

Fig. 3 Thermal shut down

Q5 is biased through the resistor string from the internal bandgap reference voltage so that it remains in off state at the ranges of the normal operating temperatures. If the junction temperature rises above 175°C, Q5 turns into on state and hence Q7 turns on, and all channel drivers are muted as the bias currents are shut down. When the junction temperature falls below 150 °C, Q5 and Q7 are turned off and the drivers operate normally. The hysteresis temperature is, thus, 25 °C

APPLICATION SUMMARY (Continued)

- CH1, CH2 and CH3 Drive Parts (Focus, Tracking , Sled Drivers)

CH1, CH2 and CH3 drive parts are composed of internal filter, V-I converter and output power amplifiers.

Fig. 4 CH1, CH2 and CH3 drive parts

- Internal primary filter

Internal primary filter is composed of sourcing/sinking current source of 22uA and forward/reverse controlled switches. It converts “FWD/REV” digital signals to analog signal as shown in Fig. 5.

Fig. 5 Output signal waveforms of the primary filter

- V-I converter

V-I converter converts filtered analog voltage signal to positive or negative steering current signals and delivers them to output power amplifiers.

- Output power amplifier

Output power amplifiers with a unity feedback configuration re-convert the current outputs of V-I converters to differential output voltage to drive motors in BTL mode.

APPLICATION SUMMARY (Continued)

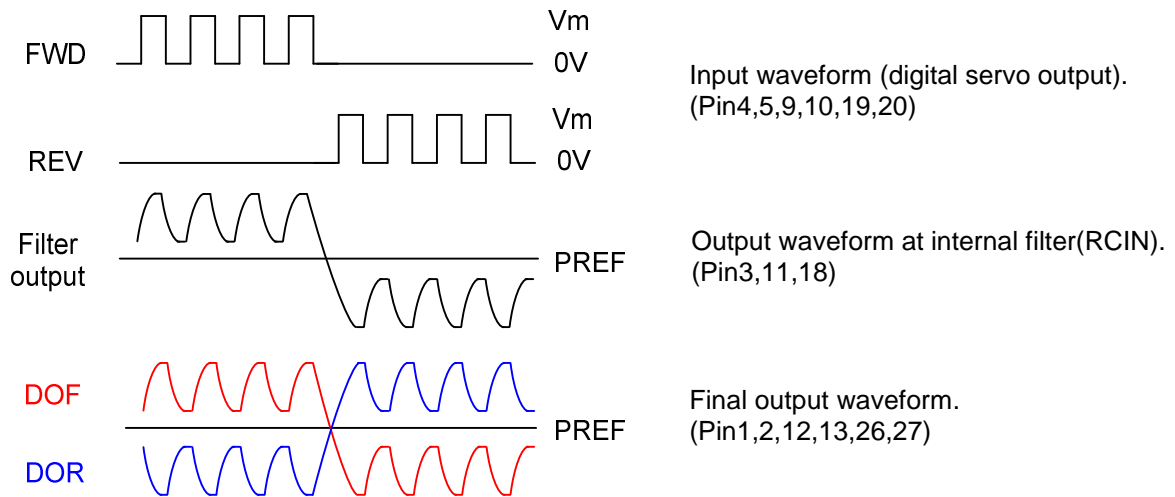

Fig. 6 Operation waveforms of CH1, CH2 and CH3 drive parts

- Operation principle

If FWD is high and REV is low, then SW_FWD and SW_REV become on and off, respectively.

This causes the internal capacitor to be charged with sourcing current of 22 uA and consequently the voltage of the filter output (RCIN) increases with the internal time constant of 2.4usec (time constant = R*C=24 pF * 100 Kohm =2.4usec). Then the output current of V-I converter is given by

$$di = \left| \frac{VRCIN}{100K} \right|$$

The output voltages of power amplifiers are, then, given as:

$$DOF = Pref + RCIN$$

$$DOR = Pref - RCIN$$

APPLICATION SUMMARY (Continued)

- CH4 spindle drive part

CH4 drive part is composed V-I converter and output power amplifiers.

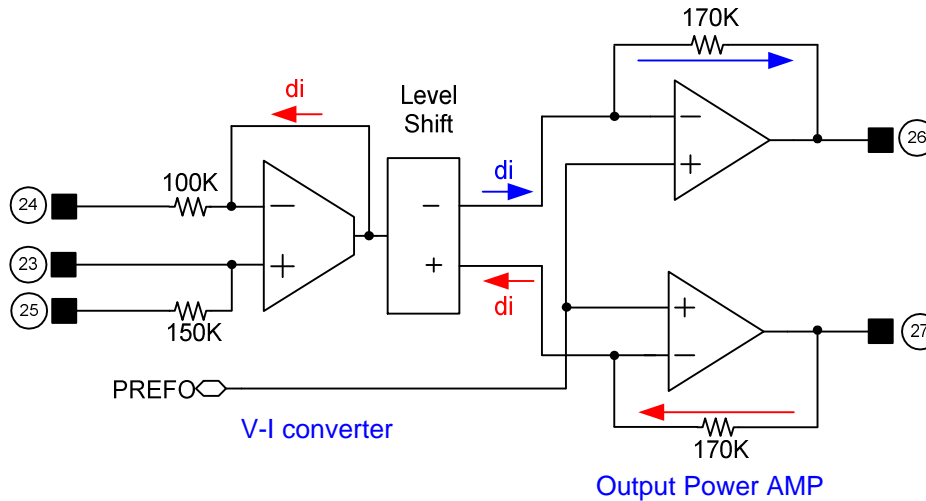

Fig. 7 CH4 spindle drive part

- The V-I converter converts the input voltage applied to pin24 into a incremental output current given by

$$di = \left| \frac{V_{in} - V_{ref}}{100K} \right| = \left| \frac{\Delta V_{in}}{100K} \right| \quad \Delta V_{in} = V_{in} - V_{ref} \quad \begin{array}{l} * V_{in} = \text{input voltage of pin24} \\ * V_{ref} = \text{reference voltage (pin23 or pin25)} \end{array}$$

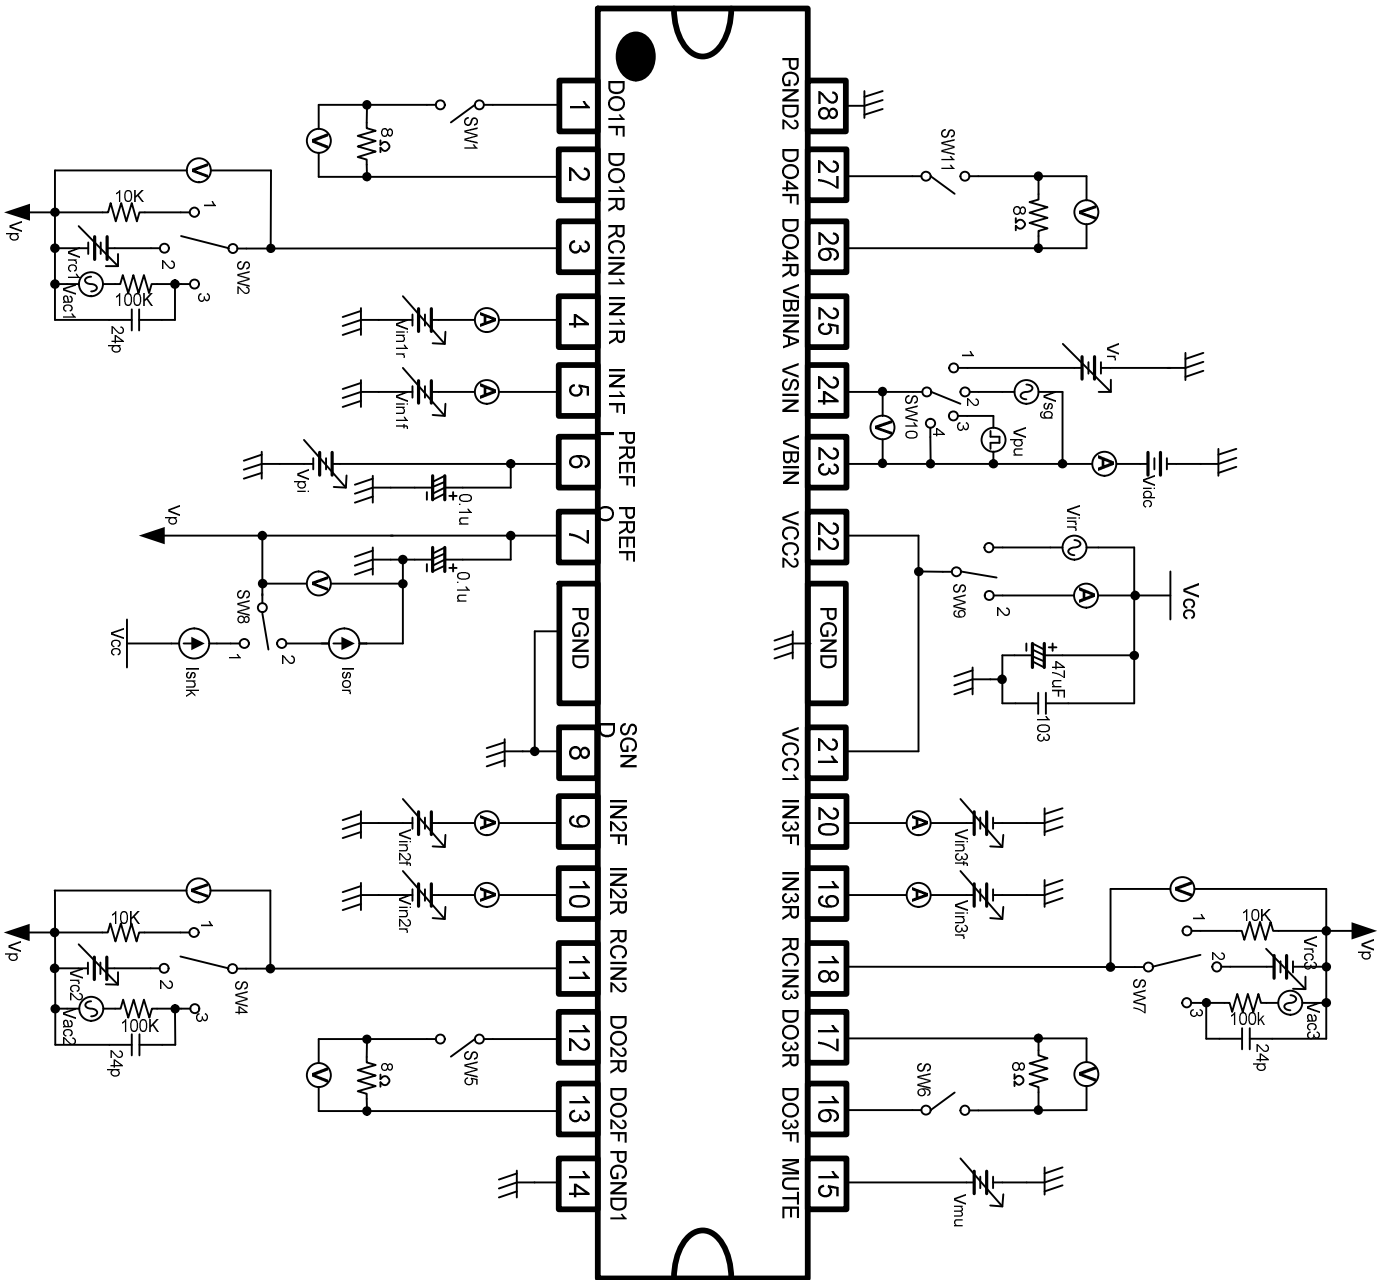

- These sourcing and sinking output current from V-I converter are delivered to output power amplifiers, where they are appeared as differential output voltages given as:

$$\begin{aligned} DOF &= Pref + di * 170K \\ DOR &= Pref - di * 170K \end{aligned}$$

- The differential voltage gain is, then, calculated as follows:

$$\begin{aligned} \Delta V_{out} &= DOF - DOR = 2 * di * 170K \\ A_{vf} &= 20 \log \left| \frac{\Delta V_{out}}{\Delta V_{in}} \right| = 20 \log \left| \frac{2 * 170K}{100K} \right| = 10.6dB \end{aligned}$$
