### **1.0 General Description**

The AMIS-710208-A7 (PI208MC-A7) is a contact image sensor (CIS) module containing contact image sensors, using MOS image sensor technology for high-speed performance and high sensitivity. The AMIS-710208-A7 is designed to scan documents with a short read length of 88mm. The module produces a single stream of sampled analog video proportional to images of a single horizontal line scan that is stepped vertically down a document page with a resolution of 8 dots per millimeter (dpm) and a width of 88mm. Applications include fax machines, game systems, variety of mark readers, and other automation equipment requiring document scanners.

### 2.0 Key Features

- Light source, lens and sensor are integrated into a single module
- 8dpm resolution, 88mm scanning length
- Up to 176µsec/line scanning speed, with 4MHz pixel rate (see Table 3, Note 2)
- Wide dynamic range
- 660nm light source
- Compact size ≅ 13mm x 25.6mm x 102mm
- Low-power
- Light weight

# **3.0 Functional Description**

The AMIS-710208-A7 imaging array consists of 11 AMIS-720233 (PI3033B) sensors, produced by AMIS, which are cascaded together to provide 704 photo-detectors (pixels) with their associated multiplex switches, and a digital shift register that controls its sequential readout. Each sensor is sequentially connected to initiate its scanning process at completion of its predecessor's scan.

Mounted in the module is a one-to-one graded-indexed micro lens array that focuses the image to be scanned onto the linear array pixels. The incident image is converted to an electrical signal and then the charge on each pixel is transferred to a common video line. The charge on each pixel is then converted to a voltage by a single video amplifier. The module output is then available on Pin 1 of the connector, Vout.

Illumination is by means of an integrated LED light source. All components are housed in a small plastic housing which has a cover glass that acts as the focal point for the object being scanned. In addition, it protects the imaging array, micro lens assembly and LED light source from dust.

Inputs and outputs (I/O's) to and from the module are by an 8-pin connector, located on one end of the module. A cross-section of the AMIS-710208-A7 module is shown in Figure 1 and a block diagram in Figure 2.

# **4.0 Input/Output Terminals**

Figure 3 shows location of the 8-pin connector, the control for adjusting the video gain and the contacts for the LED power supply. Note that the glass window is facing down.

BACK SIDE OF THE	: PCB
R18 (GAIN ADJUST)	
	Connector GLED
Figure 3: Mod	ule Rear View

"GAIN ADJUST" is used to change the analog gain. This is used to set the average video output (Vpavg) to a particular level when different exposure levels are employed. Vpavg is factory set with a particular exposure level. Note that the exposure is the product of light power and time of exposure (integration time). Since the module's light power is a constant, then the total light exposure then depends on its integration time, which is the time between two Start Pulses (SP).

The integration time is set at the factory usually according to the customer requirements; Vpavg is then adjusted to a particular level. From this level, if the integration time is decreased or increased, the specified Vpavg will increase or decrease proportionally.

If it is necessary to restore the amplitude, within a limited range, it can be adjusted with the gain control.

Vpavg is measured with the module's glass window facing down on a standard white uniform target similar to the standard white copy or typing paper.

The module connector is an 8-pin 1mm surface mount flex cable, part number Molex 52207-0890. Table 1 lists the connector pin-out and their descriptions.

#### Table 1: Pin Configuration

Pin Number	Symbol	Input/Output	Description
1	VOUT	0	Analog video output
2	Vdd	l	+5V power supply
3	Vn	l	-5V power supply
4	SP	I	SP for the shift register
5	GRD	l	Ground return for the module
6	CLOCK	l	Main clock input to the module shift register
7	GLED	l	Ground return for the LED light source
8	VLED	l	+5V power supply for the LED light source

# **5.0 Absolute Maximum Ratings**

Table 2 lists the module's absolute maximum ratings.

Table 2: Maximum Ratings			
Parameter	Symbols	Max. Rating	Units
Power supply	Vdd	7	V
	ldd	50	mA
	Vn	-10	V
	In	30	mA
	VLED	5.5	V
	ILED	400	mA
Input clock pulse, high level	Vih	Vdd – 0.5	V
Input clock pulse, low level	Vil	-0.8	V

# **6.0 Recommended Operating Environment**

Table 3 lists the module's recommended operating environment.

Table 3: Recommended Operating Environment						
Parameter	Symbol	Range	Units			
Operating temperature	Тор	0 to 50	Č			
Operating humidity	Нор	10 to 85	%			
Storage temperature	Tstg	-25 to+75	Č			
Storage humidity	Hstg	5 to 95	%			

# **7.0 Electro-Optical Characteristics**

Table 4 lists the electro-optical characteristics at 25°C

Table 4: Electro-Optical Characteristics at 25°C

Parameter	Symbol	Symbol Parameter		Comments	
Number of photo pixels		704			
Pixel-to-pixel spacing		125	μm		
Photo-response non-uniformity (1)	Up	<+/-30	%		
Adjacent pixel non-uniformity <sup>(2)</sup>	Uadj	<25	%		
Dark non-uniformity (3)	Ud	<100	mV		
Dark output voltage (4)	Vd	200 <vd<300< td=""><td>mV</td><td></td></vd<300<>	mV		
Modulation transfer function <sup>(5)</sup>	MTF	>50	%		

Notes:

1. Up = [(Vpmax-Vpavg) / Vpavg] x100% or [(Vpavg-Vpmin) / Vpavg] whichever is the largest. Where Vpmax is the maximum pixel value and Vpmin is the minimum pixel value in a single scan line.

2. Upadj = MAX[|(Vp(n)-Vp(n+1))| / vp(n)].

3. Ud=Vdmax-Vdmin; where Vdmax is the maximum pixel value and Vdmin is the minimum pixel value in the dark.

4. Vd is the average dark level.

MTF=[(Vpmax-Vpmin) / (Vpmax+Vpmin)] x 100%. Depth of focus, DOF, is defined with the MTF. It is measured with the glass surface as the reference. Vpmax is the maximum output voltage at 100lp/inch, (At ½ of Nyquest Frequency). Vpmin is the minimum output voltage at 100lp/inch.

# 8.0 Recommended Operating Conditions

Table 5 lists the recommended operating conditions at 25°C

#### Table 5: Recommended Operating Conditions at 25°C

Parameter	Symbol	Min.	Тур.	Max.	Units
Power supply	Vdd	4.5	5.0	5.5	V
	Vn	-5.5	-5.0	-4.5	V
	VLED	4.5	5.0	5.5	V
	ldd	22	25	27	mA
	lvn	4	5	6	mA
	ILED	100	150	200	mA
Input voltage at digital high	Vih	Vdd -1.0	Vdd - 0.5	Vdd	V
Input voltage at digital low	Vil	0		0.8	V
Clock frequency	Fclk		4.0	5.0	MHz
Clock pulse high duty cycle		25			%
Clock pulse high duration	Clock	62.5 <sup>(1)</sup>			ns
Integration time <sup>(1)</sup>	Tint	0.145 <sup>(2)</sup>			ms
Line scan rate <sup>(2)</sup>	Tint		176	μsec	@ 4.0MHz clock frequency
Clock frequency (3)	Fclk		4.0		MHz
Bright output voltage (4)	Vpavg		1.65 +/-0.05		Volts
Operating temperature	Тор		25	50	Ď

#### Notes:

1

The minimum tint is specified with the maximum 5.0MHz clock frequency. Tint is the line scan rate or integration time. It is the time between two start pulses. Hence, the minimum integration time is fixed by the highest clock frequency. 2. Here it is specified with a 4.0MHz clock frequency.

Fclk is the main clock frequency, as is the pixel rate. Although the specification uses 4.0MHz, the module operates up to a maximum clock frequency of 5MHz. 3.

4. Vpavg =  $\Sigma$  Vp(n) / 704; where Vp is the pixel amplitude in volts and where n is sequential pixel number in one line scan.

# 9.0 Timing Characteristics

The timing requirements are shown in Figure 4 and Table 6.

Parameters	Symbol	Min.	Тур.	Max.	Units
Clock cycle time	to		0.50		μS
Clock pulse width	tw	62.5			ns
Clock duty cycle		25		50	%
Prohibit crossing time of SP	tprh	15			ns
Data setup time	tds	20			ns
Data hold time	tdh	20			ns
Reset level delay time	tdl	50			ns
Signal sampling time	tsh			120	ns

## **10.0 Module Mechanical Dimensions**

Figure 5 shows the mechanical dimensions of the module housing.
