

HIGH-SPEED 3.3V 256/128K x 18 SYNCHRONOUS DUAL-PORT STATIC RAM WITH 3.3V OR 2.5V INTERFACE

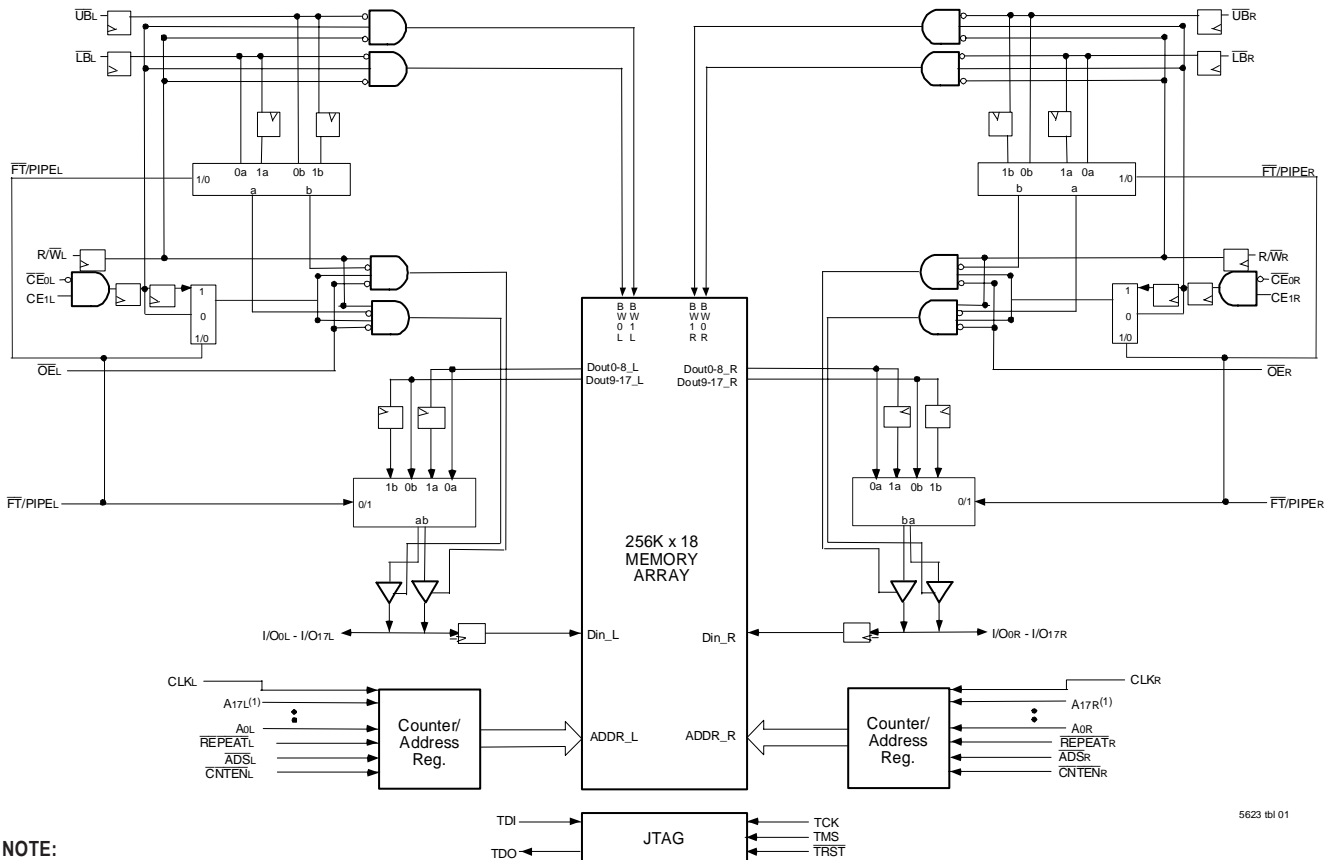

IDT70V3319/99S

Features:

- ◆ True Dual-Port memory cells which allow simultaneous access of the same memory location
- ◆ High-speed data access
 - Commercial: 3.6ns (166MHz)/4.2ns (133MHz) (max.)
 - Industrial: 4.2ns (133MHz) (max.)
- ◆ Selectable Pipelined or Flow-Through output mode
 - Due to limited pin count PL/ \overline{FT} option is not supported on the 128-pin TQFP package. Device is pipelined outputs only on each port.
- ◆ Counter enable and repeat features
- ◆ Dual chip enables allow for depth expansion without additional logic
- ◆ Full synchronous operation on both ports
 - 6ns cycle time, 166MHz operation (6Gbps bandwidth)
 - Fast 3.6ns clock to data out
 - 1.7ns setup to clock and 0.5ns hold on all control, data, and address inputs @ 166MHz

- Data input, address, byte enable and control registers
- Self-timed write allows fast cycle time
- ◆ Separate byte controls for multiplexed bus and bus matching compatibility
- ◆ Dual Cycle Deselect (DCD) for Pipelined Output mode
- ◆ LVTTTL-compatible, single 3.3V ($\pm 150\text{mV}$) power supply for core
- ◆ LVTTTL compatible, selectable 3.3V ($\pm 150\text{mV}$) or 2.5V ($\pm 100\text{mV}$) power supply for I/Os and control signals on each port
- ◆ Industrial temperature range (-40°C to +85°C) is available at 133MHz.
- ◆ Available in a 128-pin Thin Quad Flatpack, 208-pin fine pitch Ball Grid Array, and 256-pin Ball Grid Array
- ◆ Supports JTAG features compliant to IEEE 1149.1
 - Due to limited pin count, JTAG is not supported on the 128-pin TQFP package.

Description:

The IDT70V3319/99 is a high-speed 256/128K x 18 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times. With an input data register, the IDT70V3319/99 has been optimized for applications having unidirectional

or bidirectional data flow in bursts. An automatic power down feature, controlled by CE₀ and CE₁, permits the on-chip circuitry of each port to enter a very low standby power mode.

The 70V3319/99 can support an operating voltage of either 3.3V or 2.5V on one or both ports, controllable by the OPT pins. The power supply for the core of the device (V_{DD}) remains at 3.3V.

NOTES:

1. A_{17} is a NC for IDT70V3399.
2. V_{DD} , OPT_x , and V_{DDQX} must be set to appropriate operating levels prior to applying inputs on the I/Os and controls for that port.
3. OPT_x selects the operating voltage levels for the I/Os and controls on that port. If OPT_x is set to VIH (3.3V), then that port's I/Os and controls will operate at 3.3V levels and V_{DDQX} must be supplied at 3.3V. If OPT_x is set to VIL (0V), then that port's I/Os and address controls will operate at 2.5V levels and V_{DDQX} must be supplied at 2.5V. The OPT pins are independent of one another—both ports can operate at 3.3V levels, both can operate at 2.5V levels, or either can operate at 3.3V with the other at 2.5V.
4. When \overline{REPEAT}_x is asserted, the counter will reset to the last valid address loaded via \overline{ADS}_x .
5. PIPE/ \overline{FT} option in PK-128 package is not supported due to limitation in pin count. Device is pipelined output mode only on each port.
6. Chip Enables and Byte Enables are double buffered when $PL/\overline{FT} = V_{IH}$, i.e., the signals take two cycles to deselect.

5623 tbl 03

NOTES:

- "H" = V_{IH}, "L" = V_{IL}, "X" = Don't Care.
- Read and write operations are controlled by the appropriate setting of R/ \overline{W} , $\overline{CE_0}$, CE₁, \overline{UB} , \overline{LB} and \overline{OE} .
- Outputs configured in flow-through output mode: if outputs are in pipelined mode the data out will be delayed by one cycle.
- \overline{ADS} and REPEAT are independent of all other memory control signals including $\overline{CE_0}$, CE₁ and \overline{UB} , \overline{LB} .
- The address counter advances if CNTEN = V_{IL} on the rising edge of CLK, regardless of all other memory control signals including $\overline{CE_0}$, CE₁, \overline{UB} , \overline{LB} .
- When REPEAT is asserted, the counter will reset to the last valid address loaded via \overline{ADS} . This value is not set at power-up: a known location should be loaded via \overline{ADS} during initialization if desired. Any subsequent \overline{ADS} access during operations will update the REPEAT address location.

5623 tbl 06

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{TERM} must not exceed V_{DD} + 150mV for more than 25% of the cycle time or 4ns maximum, and is limited to ≤ 20 mA for the period of V_{TERM} \geq V_{DD} + 150mV.
- Ambient Temperature Under Bias. No AC Conditions. Chip Deselected.

NOTES:

- Undershoot of V_{IL} \geq -1.5V for pulse width less than 10ns is allowed.
- V_{TERM} must not exceed V_{DDQ} + 100mV.
- To select operation at 2.5V levels on the I/Os and controls of a given port, the OPT pin for that port must be set to V_{IL} (0V), and V_{DDQX} for that port must be supplied as indicated above.

NOTES:

1. These parameters are determined by device characterization, but are not production tested.
2. 3dV references the interpolated capacitance when the input and output switch from 0V to 3V or from 3V to 0V.
3. C_{OUT} also references C_{IO}.

NOTES:

- At $f = f_{MAX}$, address and control lines (except Output Enable) are cycling at the maximum frequency clock cycle of $1/t_{cyc}$, using "AC TEST CONDITIONS" at input levels of GND to 3V.
- $f = 0$ means no address, clock, or control lines change. Applies only to input at CMOS level standby.
- Port "A" may be either left or right port. Port "B" is the opposite from port "A".
- $V_{DD} = 3.3V$, $T_A = 25^\circ C$ for Typ, and are not production tested. $I_{DD} DC(f=0) = 120mA$ (Typ).
- $\overline{CE}_X = V_{IL}$ means $\overline{CE}_{0X} = V_{IL}$ and $CE_{1X} = V_{IH}$
 $\overline{CE}_X = V_{IH}$ means $\overline{CE}_{0X} = V_{IH}$ or $CE_{1X} = V_{IL}$
 $\overline{CE}_X \leq 0.2V$ means $\overline{CE}_{0X} \leq 0.2V$ and $CE_{1X} \geq V_{CC} - 0.2V$
 $\overline{CE}_X \geq V_{CC} - 0.2V$ means $\overline{CE}_{0X} \geq V_{CC} - 0.2V$ or $CE_{1X} = 0.2V$
"X" represents "L" for left port or "R" for right port.

NOTES:

- The Pipelined output parameters (t_{CYC2}, t_{CD2}) apply to either or both left and right ports when $\overline{FT}/PIPE_x = V_{IH}$. Flow-through parameters (t_{CYC1}, t_{CD1}) apply when $\overline{FT}/PIPE = V_{IL}$ for that port.
- All input signals are synchronous with respect to the clock except for the asynchronous Output Enable (\overline{OE}) and $\overline{FT}/PIPE$. $\overline{FT}/PIPE$ should be treated as a DC signal, i.e. steady state during operation.
- These values are valid for either level of V_{DDQ} (3.3V/2.5V). See page 5 for details on selecting the desired operating voltage levels for each port.

Timing Waveform of Read Cycle for Flow-through Output ($\overline{FT}/\text{PIPE}^*x = V_{IL}$)^(2,6)

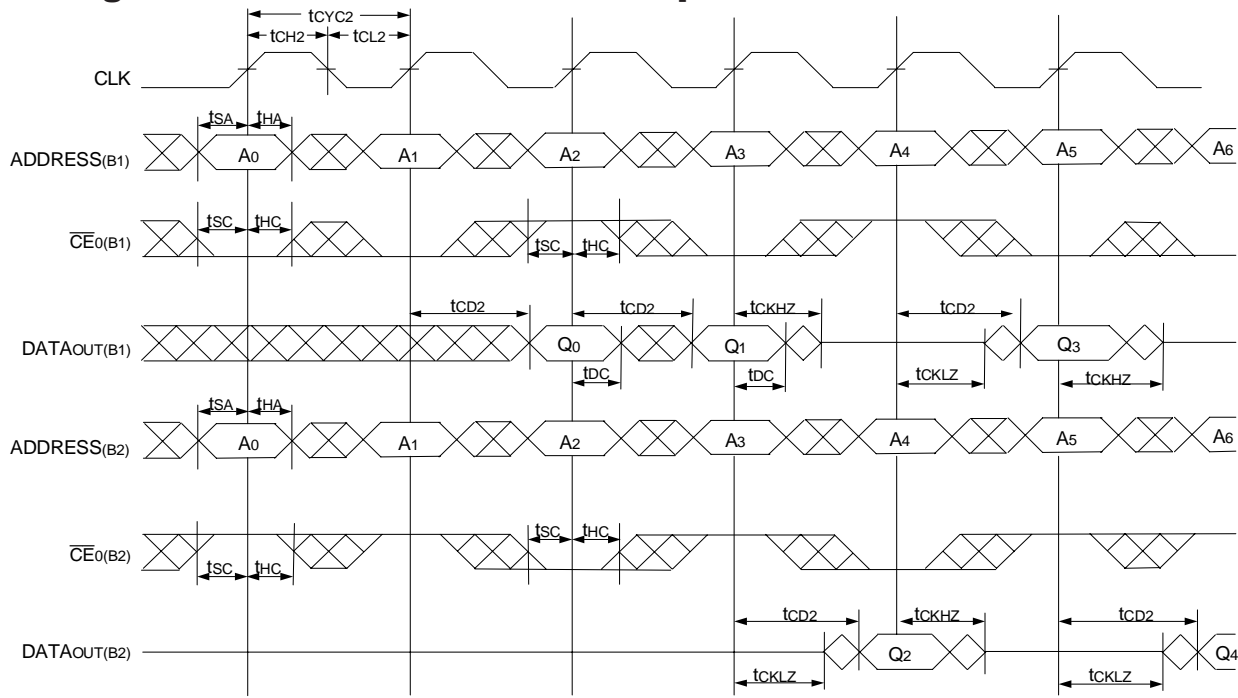

5623 drw 07

NOTES:

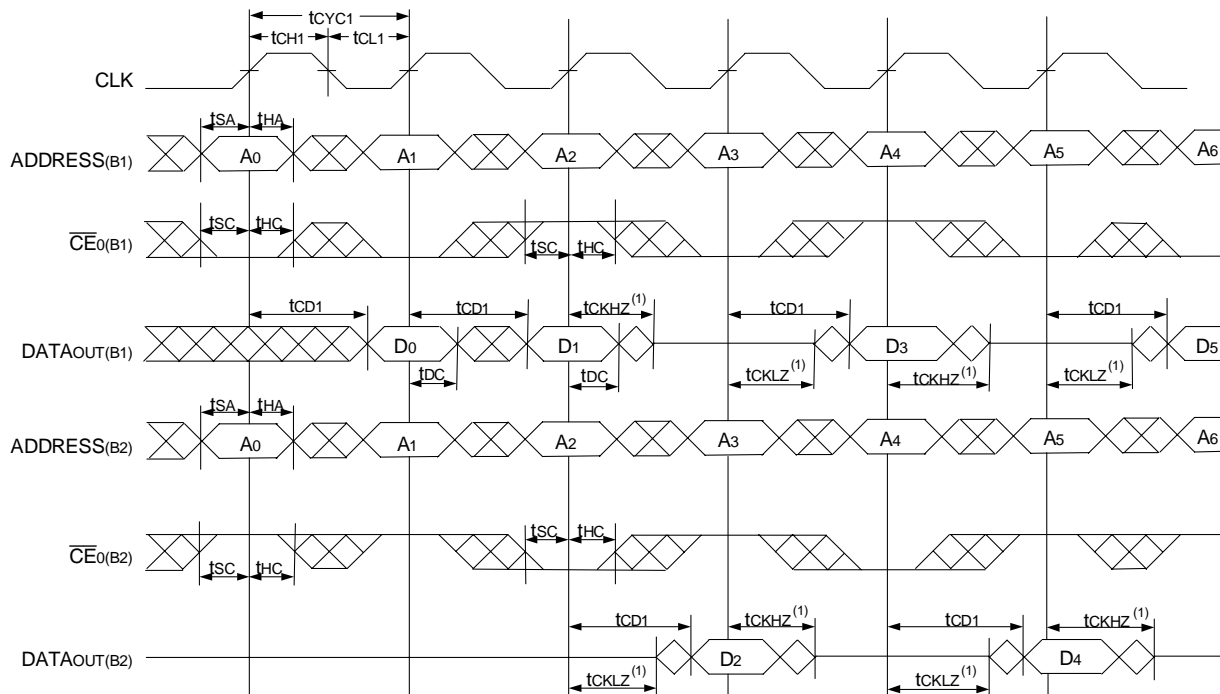

1. \overline{OE} is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
2. $\overline{ADS} = V_{IL}$, \overline{CNTEN} and $\overline{REPEAT} = V_{IH}$.
3. The output is disabled (High-Impedance state) by $\overline{CE}0 = V_{IH}$, $CE1 = V_{IL}$, \overline{UB} , $\overline{LB} = V_{IH}$ following the next rising edge of the clock. Refer to Truth Table 1.
4. Addresses do not have to be accessed sequentially since $\overline{ADS} = V_{IL}$ constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. If \overline{UB} , \overline{LB} was HIGH, then the appropriate Byte of DATAout for $Q_n + 2$ would be disabled (High-Impedance state).
6. "x" denotes Left or Right port. The diagram is with respect to that port.

NOTES:

1. B1 Represents Device #1; B2 Represents Device #2. Each Device consists of one IDT70V3319/99 for this waveform, and are setup for depth expansion in this example. ADDRESS(B1) = ADDRESS(B2) in this situation.
2. UB, LB, OE, and ADS = VIL; CE1(B1), CE1(B2), R/W, CNTEN, and REPEAT = VIH.

Timing Waveform of Left Port Write to Pipelined Right Port Read^(1,2,4)

NOTES:

1. \overline{CE}_0 , \overline{UB} , \overline{LB} , and $\overline{ADS} = V_{IL}$; CE_1 , \overline{CNTEN} , and $\overline{REPEAT} = V_{IH}$.
2. $\overline{OE} = V_{IL}$ for Port "B", which is being read from. $\overline{OE} = V_{IH}$ for Port "A", which is being written to.
3. If $t_{CO} \leq$ minimum specified, then data from Port "B" read is not valid until following Port "B" clock cycle (ie, time from write to valid read on opposite port will be $t_{CO} + 2 t_{CYC2} + t_{CD2}$). If $t_{CO} >$ minimum, then data from Port "B" read is available on first Port "B" clock cycle (ie, time from write to valid read on opposite port will be $t_{CO} + t_{CYC2} + t_{CD2}$).
4. All timing is the same for Left and Right ports. Port "A" may be either Left or Right port. Port "B" is the opposite of Port "A"

2. $\overline{OE} = V_{IL}$ for the Right Port, which is being read from. $\overline{OE} = V_{IH}$ for the Left Port, which is being written to.
3. Timing Waveform of Pipelined Read-to-Write-to-Read ($\overline{OE} = V_{IL}$)⁽²⁾

NOTES:

1. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
2. \overline{CE}_0 , \overline{UB} , \overline{LB} , and $\overline{ADS} = V_{IL}$; CE_1 , \overline{CNTEN} , and $\overline{REPEAT} = V_{IH}$. "NOP" is "No Operation".
3. Addresses do not have to be accessed sequentially since $\overline{ADS} = V_{IL}$ constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
4. "NOP" is "No Operation." Data in memory at the selected address may be corrupted and should be re-written to guarantee data integrity.

3. Addresses do not have to be accessed sequentially since $\overline{ADS} = V_{IL}$ constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
4. This timing does not meet requirements for fastest speed grade. This waveform indicates how logically it could be done if timing so allows.

Timing Waveform of Pipelined Read with Address Counter Advance⁽¹⁾

Timing Waveform of Flow-Through Read with Address Counter Advance⁽¹⁾

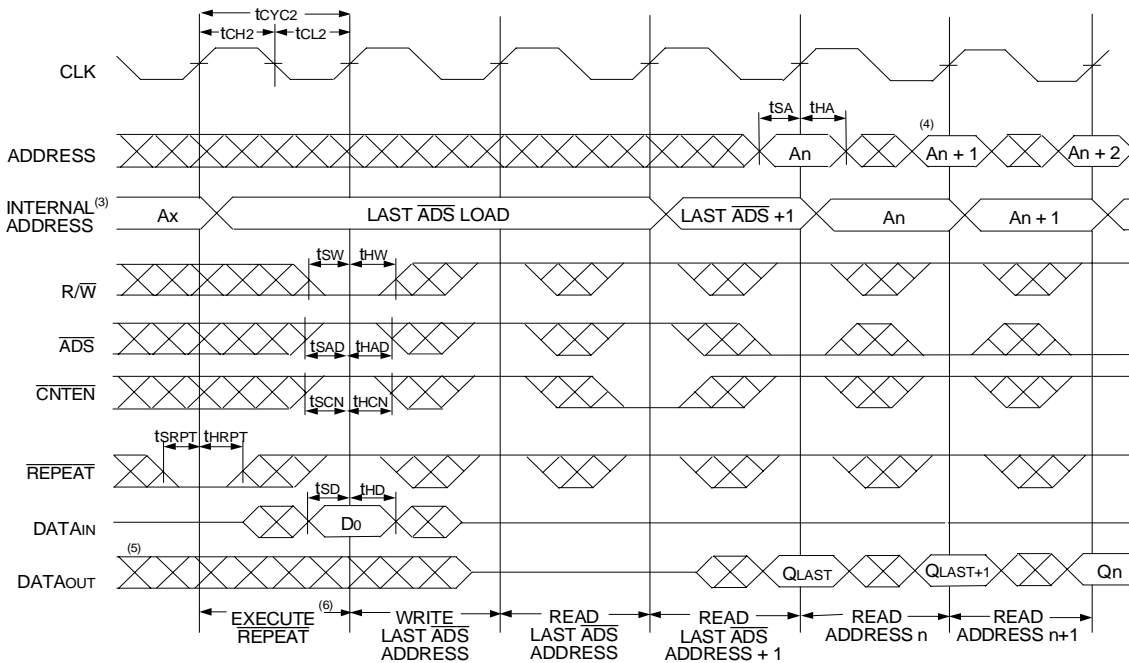

NOTES:

1. $\overline{CE}_0, \overline{OE}, \overline{UB}, \overline{LB} = V_{IL}$; $\overline{CE}_1, R/\overline{W}$, and $\overline{REPEAT} = V_{IH}$.
2. If there is no address change via $\overline{ADS} = V_{IL}$ (loading a new address) or $\overline{CNTEN} = V_{IL}$ (advancing the address), i.e. $\overline{ADS} = V_{IH}$ and $\overline{CNTEN} = V_{IH}$, then the data output remains constant for subsequent clocks.

Timing Waveform of Write with Address Counter Advance (Flow-through or Pipelined Inputs)⁽¹⁾

Timing Waveform of Counter Repeat⁽²⁾

NOTES:

1. $\overline{CE_0}$, \overline{UB} , \overline{LB} , and $R/\overline{W} = V_{IL}$; CE_1 and $\overline{REPEAT} = V_{IH}$.
2. $\overline{CE_0}$, \overline{UB} , $\overline{LB} = V_{IL}$; $CE_1 = V_{IH}$.
3. The "Internal Address" is equal to the "External Address" when $\overline{ADS} = V_{IL}$ and equals the counter output when $\overline{ADS} = V_{IH}$.
4. Addresses do not have to be accessed sequentially since $\overline{ADS} = V_{IL}$ constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
6. No dead cycle exists during REPEAT operation. A READ or WRITE cycle may be coincidental with the counter REPEAT cycle: Address loaded by last valid \overline{ADS} load will be accessed. Extra cycles are shown here simply for clarification. For more information on REPEAT function refer to Truth Table II.
7. $\overline{CNTEN} = V_{IL}$ advances Internal Address from 'An' to 'An +1'. The transition shown indicates the time required for the counter to advance. The 'An +1' Address is written to during this cycle.

Functional Description

The IDT70V3319/99 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse is independent of the LOW to HIGH transition of the clock signal.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

A HIGH on $\overline{CE_0}$ or a LOW on CE_1 for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT70V3319/99s for depth expansion configurations. Two cycles are required with $\overline{CE_0}$ LOW and CE_1 HIGH to re-activate the outputs.

Depth and Width Expansion

The IDT70V3319/99 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT70V3319/99 can also be used in applications requiring expanded width, as indicated in Figure 4. Through combining the control signals, the devices can be grouped as necessary to accommodate applications needing 36-bits or wider.
