- High-Performance Fixed-Point Digital Signal Processor (DSP) – TMS320C6205
  - 5-ns Instruction Cycle Time
  - 200-MHz Clock Rate
  - Eight 32-Bit Instructions/Cycle
  - 1600 MIPS
- VelociTI<sup>™</sup> Advanced-Very-Long-Instruction-Word (VLIW) TMS320C62x<sup>™</sup> DSP Core
  - Eight Highly Independent Functional Units:
    - Six ALUs (32-/40-Bit)
    - Two 16-Bit Multipliers (32-Bit Result)
  - Load-Store Architecture With 32 32-Bit General-Purpose Registers
  - Instruction Packing Reduces Code Size
  - All Instructions Conditional
- Instruction Set Features
  - Byte-Addressable (8-, 16-, 32-Bit Data)
  - 8-Bit Overflow Protection
  - Saturation
  - Bit-Field Extract, Set, Clear
  - Bit-Counting
  - Normalization
- 1M-Bit On-Chip SRAM
  - 512K-Bit Internal Program/Cache (16K 32-Bit Instructions)
  - 512K-Bit Dual-Access Internal Data (64K Bytes)
    - Organized as Two 32K-Byte Blocks for Improved Concurrency
- 32-Bit External Memory Interface (EMIF)
  - Glueless Interface to Synchronous Memories: SDRAM or SBSRAM
  - Glueless Interface to Asynchronous Memories: SRAM and EPROM
  - 52M-Byte Addressable External Memory Space
- Four-Channel Bootloading Direct-Memory-Access (DMA) Controller With an Auxiliary Channel
- Flexible Phase-Locked-Loop (PLL) Clock Generator

 32-Bit/33-MHz Peripheral Component Interconnect (PCI) Master/Slave Interface Conforms to:

PCI Specification 2.2

Power Management Interface 1.1 Meets Requirements of PC99

- PCI Access to All On-Chip RAM, Peripherals, and External Memory (via EMIF)
- Four 8-Deep x 32-Wide FIFOs for Efficient PCI Bus Data Transfer
- 3.3/5-V PCI Operation
- Three PCI Bus Address Registers:
   Prefetchable Memory
   Non-Prefetchable Memory I/O
- Supports 4-Wire Serial EEPROM Interface
- PCI Interrupt Request Under DSP Program Control
- DSP Interrupt Via PCI I/O Cycle
- Two Multichannel Buffered Serial Ports (McBSPs)
  - Direct Interface to T1/E1, MVIP, SCSA Framers
  - ST-Bus-Switching Compatible
  - Up to 256 Channels Each
  - AC97-Compatible
  - Serial-Peripheral-Interface (SPI)
     Compatible (Motorola™)
- Two 32-Bit General-Purpose Timers
- IEEE-1149.1 (JTAG†)
  Boundary-Scan-Compatible
- 288-Pin MicroStar BGA™ Package (GHK Suffix)
- 0.15-μm/5-Level Metal Process
  - CMOS Technology
- 3.3-V I/Os, 1.5-V Internal, 5-V Voltage Tolerance for PCI I/O Pins

## TMS320C6205 FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106D - OCTOBER 1999 - REVISED FEBRUARY 2003

#### description

The TMS320C62x<sup>™</sup> DSPs (including the TMS320C6205 device) compose the fixed-point DSP generation in the TMS320C6000™ DSP platform. The TMS320C6205 (C6205) device is based on the high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making the C6205 an excellent choice for multichannel and multifunction applications.

With performance of up to 1600 million instructions per second (MIPS) at a clock rate of 200 MHz, the C6205 offers cost-effective solutions to high-performance DSP-programming challenges. The C6205 DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide six arithmetic logic units (ALUs) for a high degree of parallelism and two 16-bit multipliers for a 32-bit result. The C6205 can produce two multiply-accumulates (MACs) per cycle for a total of 400 million MACs per second (MMACS). The C6205 DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The C6205 includes a large bank of on-chip memory and has a powerful and diverse set of peripherals. Program memory consists of a 64K-byte block that is user-configurable as cache or memory-mapped program space. Data memory consists of two 32K-byte blocks of RAM. The peripheral set includes two multichannel buffered serial ports (McBSPs), two general-purpose timers, a peripheral component interconnect (PCI) module that supports 33-MHz master/slave interface and 4-wire serial EEPROM interface, and a glueless external memory interface (EMIF) capable of interfacing to SDRAM or SBSRAM and asynchronous peripherals.

The C6205 has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

TMS320C6000 is a trademark of Texas Instruments. Windows is a registered trademark of Microsoft Corporation.

### device characteristics

Table 1 provides an overview of the C6205 DSP. The table shows significant features of each device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count, etc.

#### functional and CPU (DSP core) block diagram

#### CPU (DSP core) description

The CPU fetches VelociTI™ advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI™ VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C62x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the Functional and CPU (DSP Core) Block Diagram and Figure 1]. The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

Another key feature of the C62x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C62x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically "true"). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are "linked" together by "1" bits in the least significant bit (LSB) position of the instructions. The instructions that are "chained" together for simultaneous execution (up to eight in total) compose an execute packet. A "0" in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the 256-bit wide fetch-packet boundary, the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

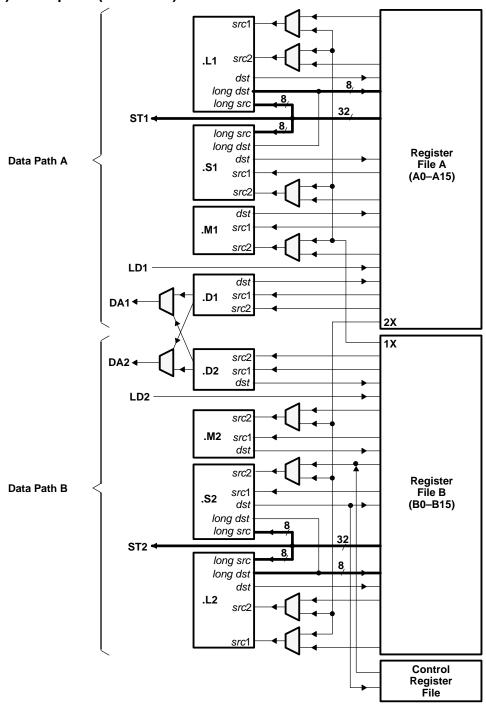

Figure 1. TMS320C62x CPU (DSP Core) Data Paths

#### memory map summary

Table 2 shows the memory map address ranges of the C6205 device. The C6205 device has the capability of a MAP 0 or MAP 1 memory block configuration. The maps differ in that MAP 0 has *external memory* mapped at address 0x0000 0000 and MAP 1 has *internal memory* mapped at address 0x0000 0000. These memory block configurations are set up at reset by the boot configuration pins (generically called BOOTMODE[4:0]). For the C6205 device, the BOOTMODE configuration is handled, at reset, by the expansion bus module (specifically XD[4:0] pins). For more detailed information on the C6205 device settings, which include the device boot mode configuration at reset and other device-specific configurations, see the Boot Configuration section and the Boot Configuration Summary table of the *TMS320C6000 Peripherals Reference Guide* (literature number SPRU190).

Table 2. TMS320C6205 Memory Map Summary

MEMORY BLOCK	BLOCK SIZE

## TMS320C6205 FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106D - OCTOBER 1999 - REVISED FEBRUARY 2003

#### development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

#### **Software Development Tools:**

Code Composer Studio™ Integrated Development Environment (IDE) including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software (DSP BIOS), which provides the basic run-time target software needed to support any DSP application.

#### **Hardware Development Tools:**

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug) EVM (Evaluation Module)

The TMS320 DSP Development Support Reference Guide (SPRU011) contains information about development-support products for all TMS320™ DSP family member devices, including documentation. See this document for further information on TMS320™ DSP documentation or any TMS320™ DSP support products from Texas Instruments. An additional document, the TMS320 Third-Party Support Reference Guide (SPRU052), contains information about TMS320™ DSP-related products from other companies in the industry. To receive TMS320™ DSP literature, contact the Literature Response Center at 800/477-8924.

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL) and select "Find Development Tools". For device-specific tools, under "Semiconductor Products" select "Digital Signal Processors", choose a product family, and select the particular DSP device. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

Code Composer Studio, XDS, and TMS320 are trademarks of Texas Instruments.

#### device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ DSP devices and support tools. Each TMS320™ DSP commercial family member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX Experimental device that is not necessarily representative of the final device's electrical

specifications

**TMP** Final silicon die that conforms to the device's electrical specifications but has not completed

quality and reliability verification

TMS Fully qualified production device

Support tool development evolutionary flow:

**TMDX** Development-support product that has not yet completed Texas Instruments internal qualification

testing.

**TMDS** Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

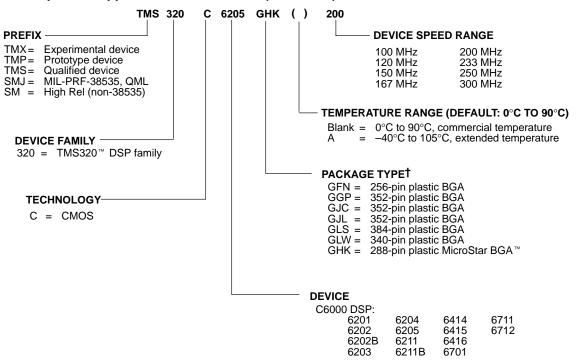

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GHK), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -200 is 200 MHz).

Figure 4 provides a legend for reading the complete device name for any TMS320C6000™ DSP family member. For the C6205 device orderable part numbers (P/Ns), see the Texas Instruments web site on the Worldwide web at http://www.ti.com URL, or contact the nearest TI field sales office, or authorized distributor.

### TMS320C6205 FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106D - OCTOBER 1999 - REVISED FEBRUARY 2003

#### documentation support

Extensive documentation supports all TMS320™ DSP family devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ DSP core (CPU) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 Peripherals Reference Guide* (literature number SPRU190) describes the functionality of the peripherals available on the C6000™ DSP platform of devices, such as the 64-/32-/16-bit external memory interfaces (EMIFs), 32-/16-bit host-port interfaces (HPIs), multichannel buffered serial ports (McBSPs), direct memory access (DMA), enhanced direct-memory-access (EDMA) controller, expansion bus (XB), peripheral component interconnect (PCI), clocking and phase-locked loop (PLL); and power-down modes. This guide also includes information on internal data and program memories.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the C62x<sup>™</sup>/C67x<sup>™</sup> devices, associated development tools, and third-party support.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of the latest C6000™ DSP documentation, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL).

See the Worldwide Web URL for the new *How to Begin Development with the TMS320C6205 DSP* application report (literature number SPRA596) which describes the functionalities unique to the C6205 device, especially the peripheral component interconnect (PCI) module interface.

C62x and C67x are trademarks of Texas Instruments.

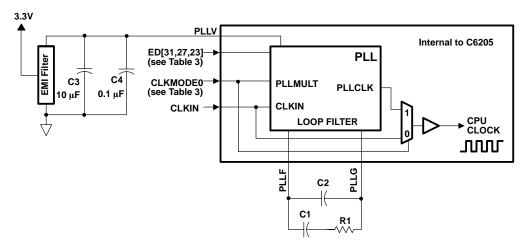

#### clock PLL

Most of the internal C6205 clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

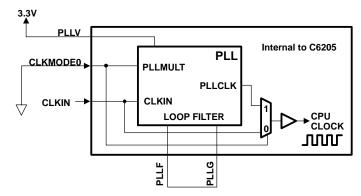

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 5. Table 3, and Table 4 show the external PLL circuitry for either x1 (PLL bypass) or x4 PLL multiply modes. Figure 6 shows the external PLL circuitry for a system with ONLY x1 (PLL bypass) mode.

To minimize the clock jitter, a single clean power supply should power both the C6205 device and the external clock oscillator circuit. Noise coupling into PLLF directly impacts PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the input and output clocks electricals section.

- NOTES: A. Keep the lead length and the number of vias between pin PLLF, pin PLLG, R1, C1, and C2 to a minimum. In addition, place all PLL components (R1, C1, C2, C3, C4, and EMI Filter) as close to the C6000™ DSP device as possible. Best performance is achieved with the PLL components on a single side of the board without jumpers, switches, or components other than the ones shown.
  - B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (R1, C1, C2, C3, C4, and the EMI Filter).
  - C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.
  - D. EMI filter manufacturer: TDK part number ACF451832-333, 223, 153, 103. Panasonic part number EXCCET103U.
  - E. At power up, the PLL requires a falling edge of RESET to initialize the PLL engine. It may be necessary to toggle reset in order to establish proper PLL operation.

Figure 5. External PLL Circuitry for Either PLL Multiply Modes or x1 (Bypass) Mode

- NOTES: A. For a system with ONLY PLL x1 (bypass) mode, short the PLLF to PLLG.
  - B. The 3.3-V supply for PLLV must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.

Figure 6. External PLL Circuitry for x1 (Bypass) PLL Mode Only

### clock PLL (continued)

Table 3. C6205 PLL Multiply Modes and x1 (Bypass) Options

CLKMODE0†	ED[31] <sup>‡</sup>	ED[27] <sup>‡</sup>	ED[23] <sup>‡</sup>	PLL MULTIPLY FACTORS	CPU CLOCK FREQ f(CPU clock)
0	Х	X	Х	x1 (Bypass)	1 x f(CLKIN)
1	0	0	0	x1 (Bypass)	1 x f(CLKIN)
1	0	0	1	x4	4 x f(CLKIN)
1	0	1	0	x8	8 x f(CLKIN)
1	0	1	1	x10	10 x f(CLKIN)
1	1	0	0	х6	6 x f(CLKIN)
1	1	0	1	x9	9 x f(CLKIN)
1	1	1	0	x7	7 x f(CLKIN)
1	1	1	1	x11	11 x f(CLKIN)

<sup>†</sup>CLKMODE0 equal to 0 denotes on-chip PLL bypassed

Table 4. C6205 PLL Component Selection Table§

CLKMODE	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY (CLKOUT1) RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 [±1%] (Ω)	C1 [±10%] (nF)	C2 [±10%] (pF)	TYPICAL LOCK TIME (μs)
x4	32.5–50						
х6	21.7–33.3						
х7	18.6–28.6						
x8	16.3–25	130–200	65–100	60.4	27	560	75
х9	14.4–22.2						
x10	13–20						
x11	11.8–18.2						

<sup>§</sup> Under some operating conditions, the maximum PLL lock time may vary as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μs, the maximum value may be as long as 250 μs.

CLKMODE0 equal to 1 denotes on-chip PLL used, except when configuration bits (ED[31], ED[27], and ED[23]) are 0 at device reset.

<sup>&</sup>lt;sup>‡</sup>ED[31], ED[27], and ED[23] are the on-chip PLL configuration bits that are latched during device reset, along with the other boot configuration bits ED[31:0].

## TMS320C6205 FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106D - OCTOBER 1999 - REVISED FEBRUARY 2003

#### power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time if the other supply is below the proper operating voltage.

#### system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

#### power-supply design considerations

For systems using the C6000™ DSP platform of devices, the core supply may be required to provide in excess of 2 A per DSP until the I/O supply is powered up. This extra current condition is a result of uninitialized logic within the DSP(s) and is corrected once the CPU sees an internal clock pulse. With the PLL enabled, as the I/O supply is powered on, a clock pulse is produced stopping the extra current draw from the supply. With the PLL disabled, as many as five external clock cycle pulses may be required to stop this extra current draw. A normal current state returns once the I/O power supply is turned on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power up and the I/O supply power up can minimize the effects of this current draw.

A dual-power supply with simultaneous sequencing, such as that available with TPS563xx controllers or PT69xx plug-in power modules, can be used to eliminate the delay between core and I/O power up [see the *Using the TPS56300 to Power DSPs* application report (literature number SLVA088)]. A Schottky diode can also be used to tie the core rail to the I/O rail, effectively pulling up the I/O power supply to a level that can help initialize the logic within the DSP.

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

## absolute maximum ratings over operating case temperature range (unless otherwise noted)†

	-	
Supply voltage ranges:	CV <sub>DD</sub> (see Note 1)	– 0.3 V to 2.3 V
	DV <sub>DD</sub> (see Note 1)	0.3 V to 4 V
	(PCI), V <sub>IOP</sub> (see Note 1)	–0.5 V to 5.5 V
	(PCI), V <sub>DDP</sub> (see Note 1)	0.3 V to 4 V
Input voltage ranges:	(except PCI), V <sub>I</sub>	0.3 V to 4 V
	(PCI), V <sub>IP</sub>	0.5 V to V <sub>IOP</sub> + 0.5 V
Output voltage ranges:	(except PCI), VO	0.3 V to 4 V
	(PCI), V <sub>OP</sub>	0.5 V to V <sub>IOP</sub> + 0.5 V
Operating case tempera	ture range, T <sub>C</sub>	0°C to 90°C
Storage temperature ra	nge, T <sub>sta</sub>	65°C to 150°C

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to VSS.

#### recommended operating conditions

		MI	l No	OM	MAX	UNIT

16	th(AWEL-ARDYH)	Hold time, ARDY high after AWE low	(WST – 3) * P + 3		ns
18	t <sub>su(ARDYL-AWEL)</sub>	Setup time, ARDY low before AWE low	-[(WST - 3) * P - 6]		ns
19	th(AWEL-ARDYL)	Hold time, ARDY low after AWE low	(WST – 3) * P + 3		ns

<sup>†</sup> To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. If ARDY does meet setup or hold time, it may be recognized in the current cycle or the next cycle. Thus, ARDY can be an asynchronous input.

## switching characteristics over recommended operating conditions for asynchronous memory cyclesद# (see Figure 13 – Figure 16)

NO.	PARAMETER		-200			
			MIN	TYP	MAX	UNIT
1	tosu(SELV-AREL)	Output setup time, select signals valid to ARE low	RS*P-2			ns
2	toh(AREH-SELIV)	Output hold time, ARE high to select signals invalid	RH * P – 2			ns
5	tw(AREL)	Pulse width, ARE low		RST * P		ns
8	td(ARDYH-AREH)	Delay time, ARDY high to ARE high	3P		4P + 5	ns
12	tosu(SELV-AWEL)	Output setup time, select signals valid to AWE low	WS * P - 2			ns
13	toh(AWEH-SELIV)	Output hold time, AWE high to select signals invalid	WH * P – 2			ns
14	tw(AWEL)	Pulse width, AWE low		WST * P		ns
17	<sup>t</sup> d(ARDYH-AWEH)	Delay time, ARDY high to AWE high	3P		4P + 5	ns

<sup>‡</sup>RS = Read Setup, RST = Read Strobe, RH = Read Hold, WS = Write Setup, WST = Write Strobe, WH = Write Hold. These parameters are programmed via the EMIF CE space control registers.

<sup>‡</sup>RS = Read Setup, RST = Read Strobe, RH = Read Hold, WS = Write Setup, WST = Write Strobe, WH = Write Hold. These parameters are programmed via the EMIF CE space control registers.

 $<sup>\</sup>S P = 1/CPU$  clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

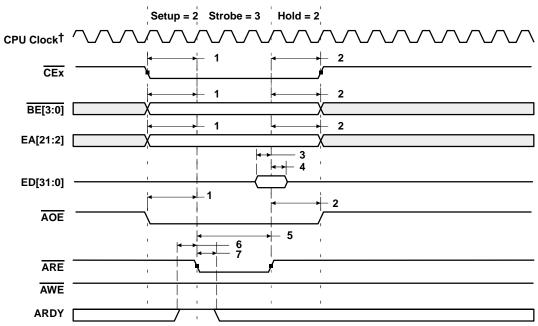

<sup>¶</sup>The sum of RS and RST (or WS and WST) must be a minimum of 4 in order to use ARDY input to extend strobe width.

 $<sup>\</sup>S P = 1/CPU$  clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

The sum of RS and RST (or WS and WST) must be a minimum of 4 in order to use ARDY input to extend strobe width.

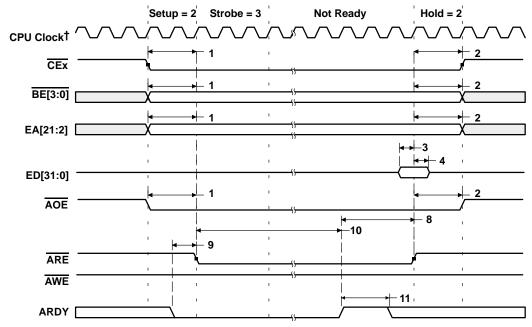

<sup>#</sup> Select signals include: CEx, BE[3:0], EA[21:2], AOE; and for writes, include ED[31:0], with the exception that CEx can stay active for an additional 7P ns following the end of the cycle.

#### HOLD/HOLDA TIMING

## timing requirements for the HOLD/HOLDA cycles<sup>†</sup> (see Figure 25)

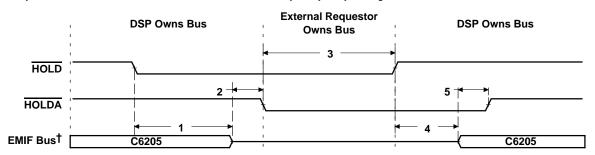

No			-200	
NO.		MIN	MAX	UNIT
3	toh(HOLDAL-HOLDL) Output hold time, HOLD low after HOLDA low	Р		ns

 $<sup>^{\</sup>dagger}$  P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

## switching characteristics over recommended operating conditions for the HOLD/HOLDA cycles†‡ (see Figure 25)

NO.	DADAMETED		-200		
	PARAMETER			MAX	UNIT
1	td(HOLDL-EMHZ)	Delay time, HOLD low to EMIF Bus high impedance	4P	§	ns
2	td(EMHZ-HOLDAL)	Delay time, EMIF Bus high impedance to HOLDA low	0	2P	ns
4	td(HOLDH-EMLZ)	Delay time, HOLD high to EMIF Bus low impedance	3P	7P	ns
5	<sup>t</sup> d(EMLZ-HOLDAH)	Delay time, EMIF Bus low impedance to HOLDA high	0	2P	ns

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns. ‡ EMIF Bus consists of CE[3:0], BE[3:0], ED[31:0], EA[21:2], ARE, AOE, AWE, SDCAS/SSADS, SDRAS/SSOE, SDWE/SSWE, and SDA10. § All pending EMIF transactions are allowed to complete before HOLDA is asserted. The worst case for this is an asynchronous read or write with external ARDY used or a minimum of eight consecutive SDRAM reads or writes when RBTR8 = 1. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting NOHOLD = 1.

† EMIF Bus consists of CE[3:0], BE[3:0], ED[31:0], EA[21:2], ARE, AOE, AWE, SDCAS/SSADS, SDRAS/SSOE, SDWE/SSWE, and SDA10.

8	td(RSTL-ZHZ)	Delay time, RESET low to Z group high impedance	Р		ns
9	<sup>t</sup> d(RSTH-ZV)	Delay time, RESET high to Z group valid	·	4P	ns

 $<sup>^{\</sup>ddagger}$  P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

High group consists of:

HOLDA

Low group consists of:

IACK, INUM[3:0], DMAC[3:0], PD, TOUT0, and TOUT1, XSP\_CLK, XSP\_DO, and XSP\_CS

Z group consists of:

 $\begin{array}{l} {\sf EA[21:2],\; ED[31:0],\; \overline{CE[3:0],\; \overline{BE[3:0],\; \overline{ARE,\; \overline{AWE,\; \overline{AOE,\; \overline{SDCAS/SSADS,\; \overline{SDRAS/SSOE,\; \overline{SDWE/SSWE,\; }}}}}, \\ {\sf SDA10,\;\; CLKX0,\;\; \underline{CLKX1,\;\; FSX0,\;\; FSX1,\;\; DX0,\;\; DX1,\;\; CLKR0,\;\; \underline{CLKR1,\;\; FSR0,\;\; FSR1,\;\; \underline{AD[31:0],\; }}} \\ {\sf PCBE[3:0],\;\; \overline{PINTA,\; \overline{PREQ},\; \overline{PSERR,\; \overline{PPERR,\; \overline{PDEVSEL,\; \overline{PFRAME,\; \overline{PIRDY},\; PPAR,\; \overline{PSTOP,\; \overline{PTRDY},\; }}}} \\ {\sf AOE,\;\; \overline{SDCAS/SSADS,\;\; \overline{SDRAS/SSOE,\; \overline{SDWE/SSWE,\; \overline{SSME,\; \overline{AOE,\; \overline{SSME,\; \overline{AOE,\; \overline{SSME,\; \overline{SME,\; \overline{SSME,\; \overline{SSM$ 

 $<sup>^{\</sup>ddagger}$ P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

<sup>§</sup> This parameter applies to CLKMODE x4, x6, x7, x8, x9, x10, and x11 only. The RESET signal is not connected internally to the Clock PLL circuit. The PLL requires a minimum of 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time, RESET must be asserted to ensure proper device operation. See the *clock PLL* section for power up (specifically Figure 5, Note E) and for PLL lock times (Table 4).

<sup>¶</sup> ED[31:0] are the boot configuration pins during device reset.

<sup>#</sup> A 250 μs setup time before the rising edge of RESET is required when using CLKMODE x4, x6, x7, x8, x9, x10, or x11.

## **RESET TIMING (CONTINUED)**

† High group consists of: Low group consists of:

_	th(CKRL-FRH)	(CKRL-FRH) Hold time, external FSR high after CLKR low	CLKR int	6		
6			CLKR ext	3		ns
	t <sub>su(DRV-CKRL)</sub>	Setup time, DR valid before CLKR low	CLKR int	8		
7			CLKR ext	0.5		ns
			CLKR int	4		
8	th(CKRL-DRV)	Hold time, DR valid after CLKR low	CLKR ext	3		ns
40		Out on the content of EOV bish by fore OLIVY have	CLKX int	9		
10	<sup>t</sup> su(FXH-CKXL)	Setup time, external FSX high before CLKX low	CLKX ext	2		ns
44	1.	Held for a set and EOV birth of the OLIVIA	CLKX int	6		
11	th(CKXL-FXH)	Hold time, external FSX high after CLKX low	CLKX ext	3		ns

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted. ‡ P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

<sup>§</sup> The maximum bit rate for the C6205 devices is 100 Mbps or CPU/2 (the slower of the two). Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 100 MHz; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 10 ns (100 MHz), whichever value is larger. For example, when running parts at 200 MHz (P = 5 ns), use 10 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 100 MHz (P = 10 ns), use 2P = 20 ns (50 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>¶</sup> The minimum CLKR/X pulse duration is either (P-1) or 4 ns, whichever is larger. For example, when running parts at 200 MHz (P = 5 ns), use 4 ns as the minimum CLKR/X pulse duration. When running parts at 100 MHz (P = 10 ns), use (P-1) = 9 ns as the minimum CLKR/X pulse duration.

## switching characteristics over recommended operating conditions for McBSP<sup>†‡</sup> (see Figure 31)

				-200		
NO.		PARAMETER				UNIT
1	td(CKSH-CKRXH)	Delay time, CLKS high to CLKR/X high for internal CLKR/X generated from CLKS input		3	12	ns
2	t <sub>c</sub> (CKRX)	Cycle time, CLKR/X	CLKR/X int	2P-2§¶		ns

4.4	<sup>t</sup> d(FXH-DXV)	Delay time, FSX high to DX valid  FXH-DXV)  ONLY applies when in data delay 0 (XDATDLY = 00b) mode.	FSX int	-1	5	
14			FSX ext	2	12	ns

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted. ‡ Minimum delay times also represent minimum output hold times.

 $^{\#}C = HorL$ 

S = sample rate generator input clock = P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKS period)

H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even

= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) \* S if CLKGDV is even

= (CLKGDV + 1)/2  $^{\star}$  S if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the 100-MHz limit.

 $<sup>\</sup>$ P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

The maximum bit rate for the C6205 devices is 100 Mbps or CPU/2 (the slower of the two). Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 100 MHz; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 10 ns (100 MHz), whichever value is larger. For example, when running parts at 200 MHz (P = 5 ns), use 10 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 100 MHz (P = 10 ns), use 2P = 20 ns (50 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.
